Contents

Preface

Scope and purpose of the HIV molecular immunology database

HIV Molecular Immunology is a companion volume to *HIV Sequence Compendium*. This publication, the 2009 edition, is the PDF version, suitable for printing, of the web-based HIV Immunology Database (`http://www.hiv.lanl.gov/content/immunology/`). The web interface for this relational database has many search options, as well as interactive tools to help immunologists design reagents and interpret their results.

In the HIV Immunology Database, HIV-specific B-cell and T-cell responses are summarized and annotated. Immunological responses are divided into three parts, CTL, T helper, and antibody. Within these parts, defined epitopes are organized by protein and binding sites within each protein, moving from left to right through the coding regions spanning the HIV genome. We include human responses to natural HIV infections, as well as vaccine studies in a range of animal models and human trials. Responses that are not specifically defined, such as responses to whole proteins or monoclonal antibody responses to discontinuous epitopes, are summarized at the end of each protein section. Studies describing general HIV responses to the virus, but not to any specific protein, are included at the end of each part.

The annotation includes information such as cross-reactivity, escape mutations, antibody sequence, TCR usage, functional domains that overlap with an epitope, immune response associations with rates of progression and therapy, and how specific epitopes were experimentally defined. Basic information such as HLA specificities for T-cell epitopes, isotypes of monoclonal antibodies, and epitope sequences are included whenever possible. All studies that we can find that incorporate the use of a specific monoclonal antibody are included in the entry for that antibody. A single T-cell epitope can have multiple entries, generally one entry per study.

Finally, maps of all defined linear epitopes relative to the HXB2 reference proteins are provided. Alignments of CTL, helper T-cell, and antibody epitopes are available through the search interface on our web site at `http://www.hiv.lanl.gov/content/immunology`.

Only responses to HIV-1 and HIV-2 are included in the database. CTL responses to SIVs are periodically summarized in our review section by Dr. David Watkins and colleagues. Dr. Christian Brander and colleagues annually provide a concise listing of optimally defined CTL epitopes. Reviews from previous years can be found at `http://www.hiv.lanl.gov/content/sequence/HIV/REVIEWS/reviews.html`.

Questions regarding the database can be sent via email to `immuno@lanl.gov`.

About the data

At the time of this publication, the HIV Immunology Database contained over 4900 CTL/CD8+ epitopes, over 1000 Helper/CD4+ epitopes, over 1400 unique antibody epitopes, and a total bibliography of over 2100 references (Figure 1). To illustrate the distribution of the epitopes, we have plotted them by position in the HIV proteome (Figure 2).

For T-cell epitopes, the density of epitopes by position reflects the density of defined epitopes in the database, which in turn roughly reflects the density of responses, as judged by EliSpot assays from natural infection. Both CTL/CD8+ T-cell (maroon) and Helper/CD4+ T-cell (green) responses are most commonly detected in Gag and Nef, and the database has the highest density of epitopes captured from the literature in these regions.

In contrast, the antibody epitope database density (blue) is less meaningfully captured in this graph, because only continuous epitopes are included. Many antibody responses defined in the database are to discontinuous epitopes, or are defined regionally or by competition experiments, and other database entries are polyclonal responses with multiple antibodies binding to multiple regions; these are not included in this map. The database entries have other biases in frequency. For example, the database is based on retrieval of information from the literature, and so a region like the V3 loop of HIV-1, which is of particular interest to investigators, has been studied with great intensity, and this high level of interest accounts for the large spike of antibody entries in gp120.

Citing the database

This publication may be cited as

HIV Molecular Immunology 2009. Karina Yusim, Bette T. M. Korber, Christian Brander, Barton F. Haynes, Richard Koup, John P. Moore, Bruce D. Walker, and David I. Watkins, editors. Publisher: Los Alamos National Laboratory, Theoretical Biology and Biophysics, Los Alamos, New Mexico.

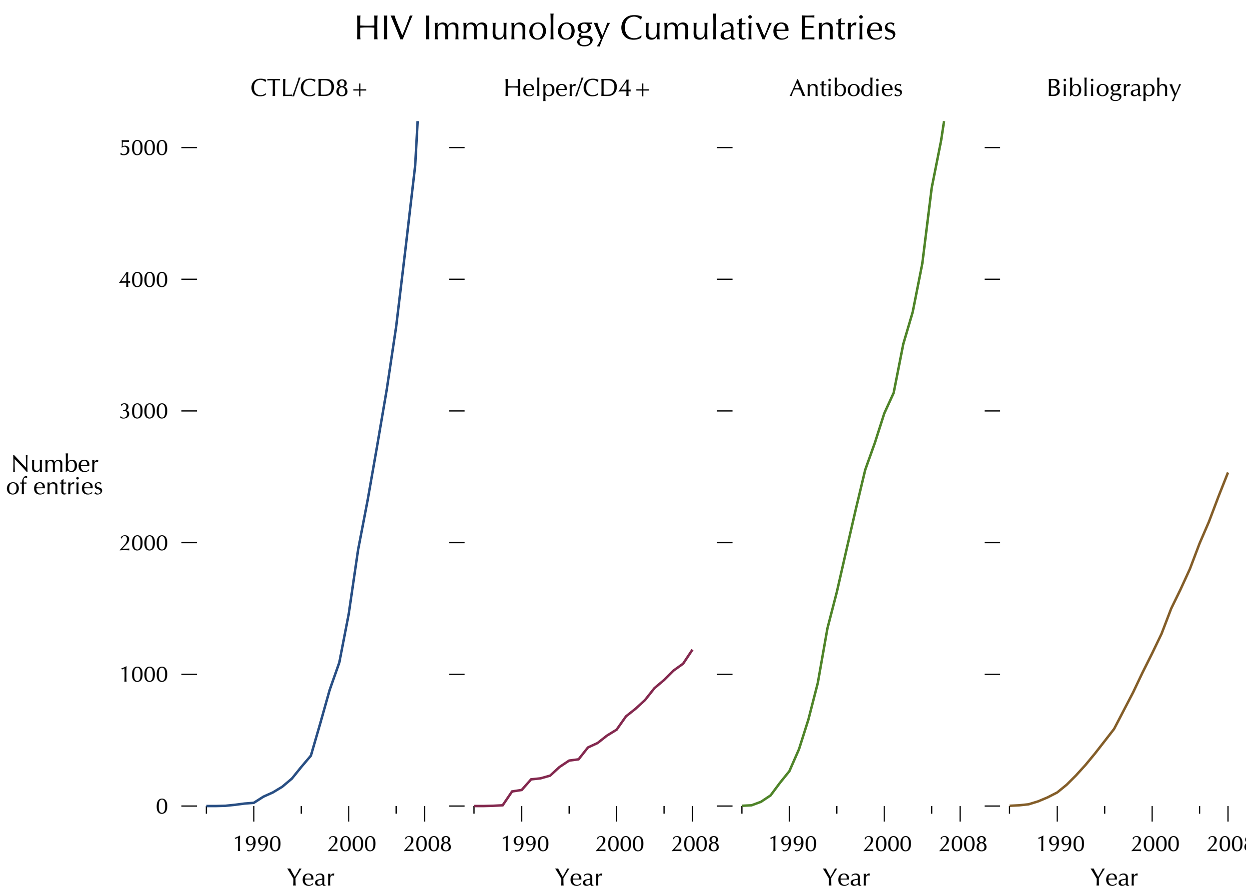

Figure 1: HIV immumology database cumulative entries. The CTL, T Helper and Antibodies plots show the total number of epitope entries described in the database at the denoted point in time. If an epitope is described in 5 papers then it is considered to be 5 entries. Thus the number of unique epitopes is lower than the plotted number. Although all 4 plots begin at 1985, the earliest CTL and Helper epitopes were described in 1987.

About the PDF

The complete *HIV Molecular Immunology 2009* is available in Adobe Portable Document Format (PDF) from our website, `http://www.hiv.lanl.gov/content/immunology`. The PDF version is hypertext enabled and features ‘clickable’ table-of-contents, indexes, references and links to external web sites.

This volume is typeset using LaTeX. The immunology data tables and epitope maps are produced automatically from the SQL database by a series of Perl programs.

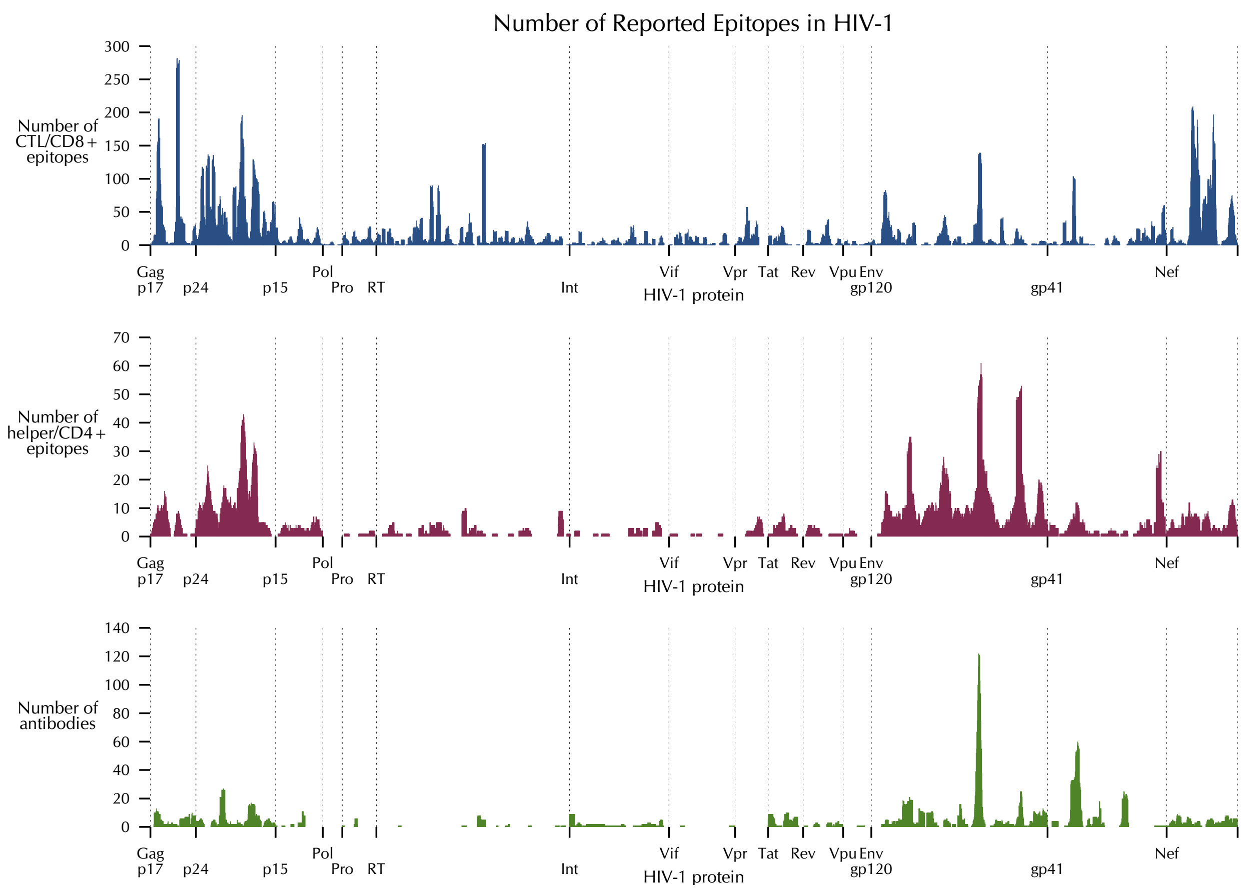

Figure 2: The number of unique epitopes included in the database that span each position in the HIV proteome.

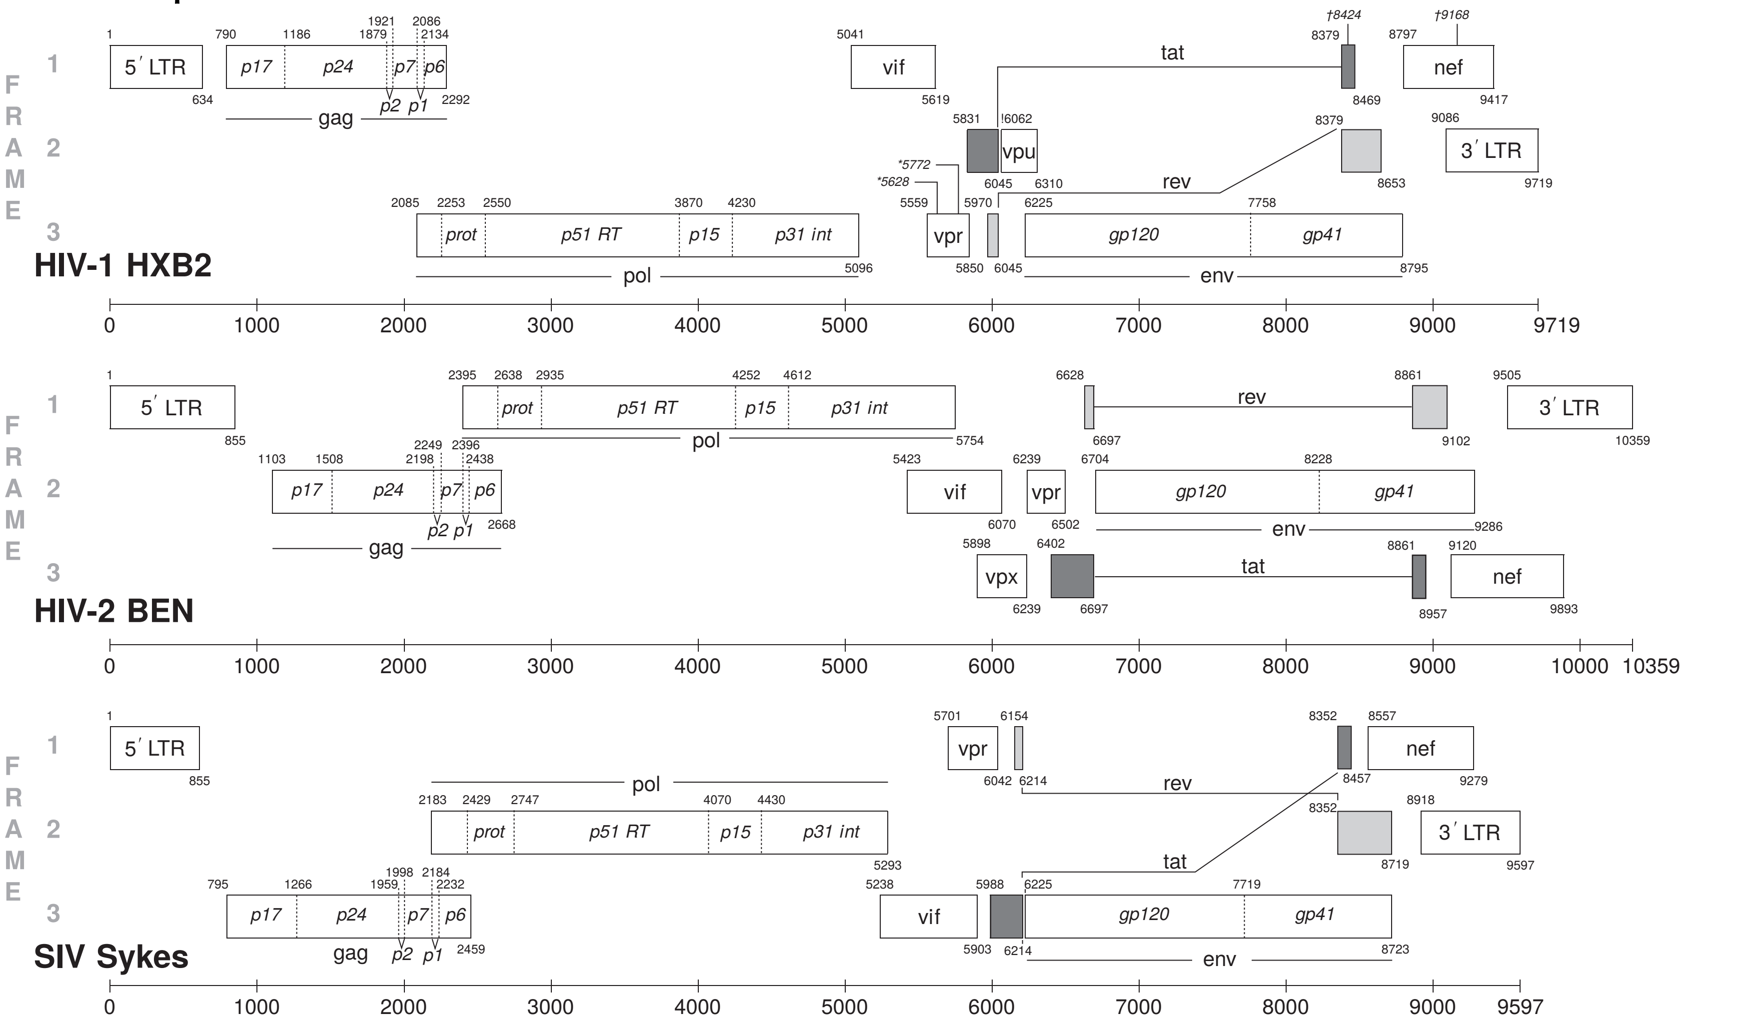
Genome maps



Landmarks of the HIV-1, HIV-2, and SIV genomes. The gene start, indicated by the small number in the upper left corner of each rectangle, normally records the position of the `a` in the `atg` start codon for that gene while the number in the lower right records the last position of the stop codon. For *pol*, the start is taken to be the first `t` in the sequence `ttttttag` which forms part of the stem loop that potentiates ribosomal slippage on the RNA and a resulting −1 frameshift and the translation of the Gag-Pol polyprotein. The *tat* and *rev* spliced exons are shown as shaded rectangles. In HXB2, *5628 and *5772 mark positions of frameshifts in the *vpr* gene; !6062 indicates a defective `acg` start codon in *vpu*; †8424 and †9168 mark premature stop codons in *tat* and *nef*. See Korber *et al.*, Numbering Positions in HIV Relative to HXB2CG, in *Human Retroviruses and AIDS*, 1998, p. 102. Available from `http://www.hiv.lanl.gov/content/sequence/HIV/REVIEWS/HXB2.html`

HIV/SIV proteins

Name	Size	Function	Localization
Gag MA	p17	membrane anchoring; env interaction; nuclear transport of viral core (myristylated protein)	virion
CA	p24	core capsid	virion
NC	p7	nucleocapsid, binds RNA	virion
	p6	binds Vpr	virion
Protease (PR)	p15	gag/pol cleavage and maturation	virion
Reverse Transcriptase (RT)	p66, p51	reverse transcription	virion
RNase H	(heterodimer)	RNAse H activity	virion
Integrase (IN)		DNA provirus integration	virion
Env	gp120/gp41	external viral glycoproteins bind to CD4 and chemokine co-receptors	plasma membrane, virion envelope
Tat	p16/p14	viral transcriptional transactivator	primarily in nucleolus/nucleus
Rev	p19	RNA transport, stability and utilization factor (phosphoprotein)	primarily in nuleolus/nucleus shuttling between nucleolus and cytoplasm
Vif	p23	viral infectivity factor, inhibits minus-strand viral DNA hypermutation	cytoplasm (cytosol, membranes), virion
Vpr	p10-15	promotes nuclear localization of preintegration complex, inhibits cell division, arrests infected cells at G2/M	virion nucleus (nuclear membrane?)
Vpu	p16	promotes extracellular release of viral particles; degrades CD4 in the ER; (phosphoprotein only in HIV-1 and SIVcpz)	integral membrane protein
Nef	p27-p25	CD4 and class I downregulation (myristylated protein)	plasma membrane, cytoplasm, (virion?)
Vpx	p12-16	Vpr homolog present in HIV-2 and some SIVs, absent in HIV-1	virion (nucleus?)
Tev	p28	tripartite tat-env-rev protein (also named Tnv)	primarily in nucleolus/nucleus

Abbreviations

Abbreviations and acronyms used in this database.

Abbrev.	Meaning
AA	amino acid
AAV	adeno-associated virus
Ab	antibody
ACTG	AIDS clinical trial group
ADC	AIDS dementia complex
ADCC	antibody-dependent cell-medicated cytotoxicity
ADE	antibody-dependent enhancement
ADRA	Antiviral Drug Resistance Analysis: a program that analyzes your sequences for mutations known to confer drug resistance and links to the records in the database
AIDS	acquired immunodeficiency syndrome
ANN	artificial neural networks
APC	antigen presenting cell
ARC	AIDS related complex
ART	anti-retroviral therapy
AZT	azidothymidine
BIMAS	BioInformatics and Molecular Analysis Section
BIV	bovine immunodeficiency virus
BLAST	Basic Local Alignment Search Tool
CAEV	caprine arthritis/encephalitis virus
CD4BS	CD4 binding site
CD4i	antibody that has enhanced binding to gp120 in the presence of SCD4 (CD4 induced)
CDC	Centers for Disease Control and Prevention
CDR	complementary determining regions
CFA	complete Freund's adjuvant
CHI	Center for HIV Information
CMI	cell-mediated immunity
CMV	cytomegaliovirus
CNS	central nervous system
CP	canary pox
CRF	circulating recombinant form
CsA	cyclosporine A
CSF	cerebrospinal fluid
CTL	cytotoxic T lymphocyte
CTLe	CTL effector
CTLp	CTL precursor
CyPA	cyclophilin A
DC	dendritic cell
DDDP	DNA-dependent DNA polymerase
DHH	U. S. Department of Health and Human Services
dMM	deopymannojirimycin
dpc	days post challenge
DTT	dithiothrietol

Abbrev.	Meaning
EIA	enzyme immuno assay
EIAV	equine infectious anemia virus
ELF	Epitope Location Finder
ELISA	Enzyme Linked ImmunoSorbent Assay
ER	endoplasmic reticulum
Fabs	fragment antigen binding-univalent antibody fragment
FATT-CTL	Fluorescent antigen-transfected target cell–CTL
FIV	feline immunodeficiency virus
FP	fowl pox
FSW	female sex worker
GALT	gut-associated lymphoid tissues
GDE format	Genetic Data Environment
gp	glycoprotein
GRIV	genetic resistance to HIV
HAART	highly-active anti-retroviral therapy
HCV	hepatitis C virus
HEPS	HIV-exposed persistently seronegative
HIV	human immunodeficiency virus
HIVD	HIV-1 dementia
HLA	human leukocyte antigens
HLA-MHC	human leukocyte antigens-major histocompatibility complex
HMM	hidden Markov models
IAVI	International AIDS Vaccine Initiative
IDE	immunodominant epitope
IE genes	immediate early genes
IFA	incomplete Freund's adjuvant
IFN	interferon
IG format	IntelliGenetics format
Ig	immunoglobulin
IL	interleukin
INHI	immunologically normal HIV-infected
iscom	immunostimulating complex
KLH	keyhole limpet hemocyanin
LANL	Los Alamos National Laboratory
LDA	limiting dilution assay
LN	lymph node
LPR	lymphoproliferative response
LT	labile enterotoxin
LTNP	long-term non-progressor
LTR	long terminal repeat
LTS	long term survivor
mAb	monoclonal antibody
MBL	mannose-binding lectin
MCMC	Markov chain Monte Carlo
MDP	muramyl dipeptide
MEI	multiple epitope immunogen
MHC	major histocompatibility complex
MHR	major homology region
ML	maximum likelihood
MLV	murine leukemia virus

Abbrev.	Meaning
MP	maximum parsimony
mpc	months post challenge
MPER	membrane-proximal external region
MRC	Medical Research Council, UK
MSF	multiple sequence alignment format of the GCG sequence analysis package
MV	measles vector
MVA vector	modified vaccinia virus Ankara
Nab	neutralizing antibody
NCBI	National Center for Biotechnology Information
NIAID	National Institute of Allergies and Infectious Diseases
NIBSC	National Institute for Biological Standards and Control, UK
NIH	National Institutes of Health
NIST	National Institute of Standards and Technology
NJ	neighbor joining
NLS	nuclear localization signal
NRP	non-rapid progressor
NSI	non-synctium-inducing
p	protein
PB	peripheral blood
PBL	peripheral blood lymphocyte
PBMC	peripheral blood mononuclear cell
PCOORD	principal coordinate analysis
PCR	polymerase chain reaction
PERV	porcine endogenous retrovirus
PHYLIP	Phylogeny Inference Package
PL	proteoliposome
RAC	ricin A chain
RDDP	RNA-dependent DNA polymerase
rec/r	recombinant
RIP	Recombinant Identification Program: a program for detecting evidence of inter-subtype recombination
RIPA	Radio Immuno Precipitation Assay
RP	rapid progressor
RRE	Rev-responsive element
rsgp160	recombinant soluble gp160
RSV	Rous sarcoma virus
SAM	Sequence Alignment and Modeling program
SAP	sequential antigen panning
sCD4	soluble CD4
scFv	single-chain variable fragment
SDS	sodium duodecyl sulfate
SFV	Semliki Forest virus
SI	synctium inducing
SIV	simian immunodeficiency virus

Abbrev.	Meaning
SIVE	SIV encephalitis
SLE	systemic lupus erythhermatosis
SNAP	synonymous-nonsynonymous analysis program
STI	supervised treatment interruption (also seen as structured treatment interruption and standard treatment interruption)
TCLA	T cell line adapted
TCR	T-cell receptor
Th	T-helper cell
TNF	tumor necrosis factor
VEE	Venezuelan equine encephalitis
VESPA	Viral Epidemiology Signature Pattern Analysis
VIP	vasoactive intestinal peptide
VL	viral load
VLP	virus like particle, assembled from p55 gag
VSV	vesicular stomatitis virus
VV	vaccinia virus
WB	Western Blot

Amino Acid Codes

A	Alanine
B	Aspartic Acid or Asparagine
C	Cysteine
D	Aspartic Acid
E	Glutamic Acid
F	Phenylalanine
G	Glycine
H	Histidine
I	Isoleucine
K	Lysine
L	Leucine
M	Methionine
N	Asparagine
P	Proline
Q	Glutamine
R	Arginine
S	Serine
T	Threonine
V	Valine
W	Tryptophan
X	unknown or “other” amino acid
Y	Tyrosine
Z	Glutamic Acid or Glutamine
.	gap
-	identity
$	stop codon
#	frameshift

How to Optimally Define Optimal Cytotoxic T Lymphocyte Epitopes in HIV Infection?

Anuska Llano[a], Nicole Frahm[b], Christian Brander[a,c]

I-A-1 The evolution of the optimal CTL epitope list at Los Alamos HIV Immunology database

T-cell responses to HIV infection were first described in 1987, when Walker *et al.* [1987] and Plata *et al.* [1987] independently showed CD8 T-cell reactivity against viral proteins. Soon after, the first epitopes were identified using short synthetic peptides, allowing for ever-increasingly detailed assessments of HIV-specific immune responses and HIV evolution analyses [Kawashima *et al.*, 2009; Nixon *et al.*, 1988]. To date, more than 1200 individual HLA class I-restricted HIV-1 epitopes have been identified, with 276 of these characterized in detail and defined to their minimal or optimal length. With the initiation of large international cohorts of individuals who are in very early stages of infection or who have superior ability to control viral replication, the establishment of multi-national research consortia, and the development of sophisticated viral genome sequencing and analysis tools, many epitopes have been assessed for their relative contribution to the natural control of HIV infection and potential suitability as vaccine immunogens. While many studies take advantage of the detailed description of previously identified and oftentimes immunodominant epitopes, a number of recent studies highlight the importance of subdominant responses, T-cell activities to variable targets, and responses present at the very earliest time points after infection, as these factors may play a crucial role in viral control [Bansal *et al.*, 2005; Frahm *et al.*, 2006; Goonetilleke *et al.*, 2009]. By nature, these responses have not been identified frequently, and in some cases have not undergone the extensive work-up that has been given to the immunodominant responses restricted by frequent HLA class I alleles. The description of such responses poses a challenge to those who strive to provide the HIV community and T-cell immunologist with a reliable resource of well-defined T-cell epitopes. In our attempt to maintain such a resource at the Los Alamos National Laboratory HIV database, we face this challenge frequently, and the following sections outline some of the considerations that shape our product of the "optimal" CTL epitope list.

This year's update of the Los Alamos HIV Immunology Database CTL epitope listing marks the 15th year since we initiated this online list, which has proven a useful tool for the HIV community at large. Based on a few in-house criteria, we have over the years created what we refer to as the "A-list", which contains only those epitopes for which we are fairly confident that they have been defined to their optimal length and for which restriction by a specific HLA class I allele has been indisputably demonstrated. At the same time, we have included in the general section of the database a "B-list" of all T-cell epitopes that have been described in the literature. Thus, within the Los Alamos HIV Immunology database, all studies describing specific T-cell responses to either short peptides or longer segments are included. In addition, search tools on the web site allow rapid searches for these T-cell targets and the retrieval of summarized details about the study in which these responses were defined. As a consequence, any reported T-cell response to HIV should be accessible at LANL, whether it was identified in natural infection or vaccination, including responses defined in individuals with or without specifically defined HLA alleles and with or without a known level of disease control. This information is retained with the epitopes in the full "B-list" database, which can be accessed using a web-based search interface (`http://www.hiv.lanl.gov/content/immunology/ctl_search`). We highlight this fact to encourage anyone accessing the database to go beyond the epitopes given in the A-list whenever the specific study warrants inclusion of less well-defined CTL activities. Including a broader range of epitopes may help to ascertain one's own findings, and potentially allow one to infer, for instance, a potential HLA restriction in a given subject for whom only limited samples are available

In *HIV Molecular Immunology 2009.* Karina Yusim, Bette T. M. Korber, Christian Brander, Barton F. Haynes, Richard Koup, John P. Moore, Bruce D. Walker, and David I. Watkins, editors. Publisher: Los Alamos National Laboratory, Theoretical Biology and Biophysics, Los Alamos, New Mexico. p. 3–24.

and who thus needs to be analyzed in a less full-blown approach.

I-A-2 Why should we bother with a list of optimally defined epitopes?

As mentioned above, the "optimal/A-list" of HIV epitopes is based on a number of in-house, arbitrary criteria, which we have regularly reviewed over the years. In brief, these criteria include the unequivocal experimental demonstration of restriction by a specific HLA class I allele and the definition of the optimal epitope length. The latter is defined as the peptide truncation that, in its shortest version, elicits a maximal functional response. While in earlier years, serial truncations were often used at decreasing concentrations in cytotoxicity (Cr51 release) assays, more recent studies often use the EliSpot or flow-cytometry based detection of effector functions including cytokine release or expression of CD107. Although these different effector functions have been shown to be subject to variable activation (i.e., peptide concentration) thresholds [Betts *et al.*, 2004], we have not seen or heard of an example in which one or the other marker would have identified different optimal epitope lengths. Aside from HLA restriction and optimal epitope definition, there are no other criteria that we consider for inclusion in the A-list. This practice has sometimes appeared to be overly strict, and a reasonable case can be made for diverging views. While we regularly discuss the input we receive from investigators in the field, our consensus remains to base our selection on the above criteria and to include only the very best defined epitopes in this listing. The major rationale for this is to keep the list free of epitopes that have been defined based on incomplete HLA restriction assays, (mis)interpretation of the data, insufficient arrays of peptide truncations tested or, in a few cases, pure speculation regarding epitope length and HLA restriction. The B list includes essentially all of the epitopes as defined in the published literature by primary authors, thus these less well-defined epitopes are captured in the database as well.

As our optimal epitope list has served as a training set for several epitope prediction algorithms (`http://www.syfpeithi.de/`, `http://atom.research.microsoft.com/bio/epipred.aspx`), we also feel that epitopes that are characterized based on HLA prediction tools should not be included in the A-list. Otherwise, the risk exists that an algorithm may use a training set that contains data that are the product of its own predictions. While this may not be a big issue for those alleles for which many epitopes have been described, cases such as epitopes presented on HLA-B63 (B*1516, B*1517) indicate that existing tools would not have been able to identify the true breath of the allele-specific binding motifs and would have in some cases led to the wrong prediction of optimal epitope length [Frahm *et al.*, 2005]. The prediction of possible HLA restriction is also complicated by the fact that most HIV epitopes can be presented in the context of several different HLA class I alleles [Frahm *et al.*, 2007]. Thus, while the individual response in a single subject will likely provide reliable data, the issue of incorrect, or at least incomplete HLA restriction assignment becomes a real problem in individuals expressing multiple alleles that can present the epitope under study. Apart from the well-described epitope sharing between alleles in the same locus and HLA supertype, such as A3/A11 or B57/B58, individuals mounting, for instance, a response to the known HLA-B37 and B57 `YFPDWQNYT` epitope in Nef, could mount these responses through HLA-A29, -B35, or -C06 [Frahm *et al.*, 2007]. If two or more of these alleles are expressed in a given individual, only a detailed functional HLA restriction analysis could provide reliable HLA restriction information. While this example may seem far-fetched, it only highlights one situation where experimental proof for presentation in the context of at least five alleles has been published. Similar examples exist for HCV epitopes and, in cases where alternatively presenting alleles are encoded by more or less frequent haplotype combinations, will certainly distort immunodominance analyses and have an impact on viral evolution analyses [Niu *et al.*, 2009]). In addition, it is also possible that individuals make responses to a single epitope on more than one of their alleles. This has been analyzed only for a few epitopes and mainly in the context of well-described allele pairs in the same supertype; thus the consequences of a potential "functional homozygosity" (i.e., presentation of a limited set of epitopes on several HLA alleles with similar epitope binding motifs) on viral control *in vivo* and immune evasion of the virus is unknown. Finally, it is also important not to rely on "defining" individual 4-digit typing by inference from larger HLA data sets from unrelated populations and ethnicities. Although haplotype frequencies for well-studied populations have been fairly well established, the ongoing expansion of HIV-related studies and vaccine trials into populations for which these data are limited, introduces a considerable risk of predicting incorrect subtypes. While this may be a particular issue for HLA-B15 and A68 alleles (for which subtypes fall into separate HLA supertypes and thus present vastly different epitopes), the case of HLA-B35 and others (A2, B44, etc.) clearly illustrates that high-resolution typing should be employed for the best definition of HLA restriction [Sidney *et al.*, 2008].

Similar to detailed HLA restriction analyses, there are several reasons why definition of optimal epitope length should be based on experimental analysis rather than binding motif predictions or only partial truncations. While some hints from available epitope sequences may be helpful in the experimental design of truncation studies or overlapping peptide synthesis (such as the elimination of possible rare ("forbidden") C-terminal residues; `http://www.hiv.lanl.gov/content/sequence/PEPTGEN/peptgen.html`), only a systematic approach will clarify the identity of the targeted sequence. An older example of how this may affect epitope response patterns is the case of two embedded B57 epitopes, where one shorter version is fully contained in a longer epitope sequence [Goulder *et al.*, 2000c]. As shown in our own analyses on promiscuous epitope presentation, embedded epitopes can also be presented on different HLA molecules, again highlighting that HLA restriction and fine mapping approaches need to go hand in hand [Frahm *et al.*, 2007]. Importantly, shorter is not necessarily better, as has been shown in a number of cases where bulged epitopes were presented in the context of alleles such as HLA-B35 and its subtypes [Burrows *et al.*, 2006]. Existing prediction algorithms, trained on existing data of mostly 9–10mer epitope sequences, could not possibly predict these epitopes and their HLA restrictions. Rather, the mapping analyses ideally start from the full-length peptide that initially elicited the detected response (often an overlapping peptide of 15-18 amino acids in length). The ever-decreasing cost for peptide synthesis and the development of collaborative studies among laboratories where many peptide truncations already exist will hopefully enable many more research groups to conduct such additional analyses.

While we strive to collect all well-characterized CTL epitopes in our list of optimally defined CTL epitopes, we are also trying to strike a balance between including as much information and as many epitopes as possible while avoiding the potential detrimental effects of including epitopes that are not conclusively defined. Since most epitopes represent correctly defined optimal targets in a clinically-relevant setting [Goonetilleke *et al.*, 2009], they do put us in the difficult position of either relaxing the inclusion criteria or asking for additional analyses to be conducted. We however also feel that their inclusion in the comprehensive listing (B-list) of the HIV Immunology Database will make such information readily accessible to the wider research community, in the end providing a benefit for all involved in the definition of protective immune responses, T-cell immunity and viral evolution. At the same time, we remain open to suggestions on how we could improve the A-list so that it meets the changing needs of the community. For any comments, please contact us.

I-A-4 Map of optimal HIV-1 CTL epitopes

The location and HLA restriction elements of CTL epitopes are indicated on protein sequences of HXB2. These maps are meant to provide the relative location of defined epitopes on a given protein, but the HXB2 sequence may not actually carry the epitope of interest, as it may vary relative to the sequence for which the epitope was defined.

Part II

HIV CTL/CD8+ Epitopes

II-A

Summary

This part includes tables, maps, and associated references of HIV-specific CTL epitopes found in the literature arranged sequentially according to the location of the proteins in the HIV-1 genome. We attempted to make this part as comprehensive as possible, requiring that the epitope be contained within a defined region of a maximum of 30 amino acids, but not that the optimal boundaries be defined. Studies that were based on the analysis of whole proteins are described at the end of each protein section. The same epitope can have multiple entries, as each entry represents a single publication in this part of the database. For more recent updates, epitope sequence alignments, and useful search capabilities, please see our web site: `http://www.hiv.lanl.gov/content/immunology`. For a concise listing of only the best defined CTL epitopes, see the summary by Nicole Frahm, Brett Baker and Christian Brander on page 3 in Part I of this compendium. CTL responses to proteins with no defined epitopes are listed at the end of each protein section.

Recent studies utilize multiple functions attributed to T cells to define responses, and the simple distinctions of cytotoxic T-cell and helper T-cells have become blurred as more is learned about the range of responses triggered in CD4 and CD8 positive T-cells responding to antigenic stimulus. When adding the most recent studies to the database, we have tried to place T cell responses in a reasonable manner into our traditional helper T cell and CTL parts, and to specify the assay used to measure the response in each study.

II-A-1 Epitope tables

Each CTL reference has a multi-part basic entry:

HXB2 location: The viral strain HXB2 (GenBank Accession Number K03455) is used as a reference strain throughout this publication. The position of the defined epitope location relative to the sequence of the HXB2 protein is indicated. The numbering in this table corresponds to the protein maps. Because of HIV-1 variation the epitope may not actually be present in HXB2; rather, the position in HXB2 indicates the position aligned to the epitope. HXB2 was selected as the reference strain because so many studies use HXB2, and because crystal structures for HXB2-related proteins are often available. The precise positions of an epitope on the HXB2 reference strain can be readily obtained using the interactive position locator at our web site: `http://www.hiv.lanl.gov/content/sequence/LOCATE/locate.html`.

Author location: The amino acid positions of the epitope boundaries and the reference sequence are listed as given in the primary publication. Frequently, these positions as published are imprecise, and do not truly correspond to the numbering of the sequence, but they provide a reasonable guide to the peptide's approximate location in the protein. Also, in many cases the reference sequence identification was not provided, and in such cases it is not possible to use these numbers to specify precise locations.

Epitope: The amino acid sequence of the epitope of interest as defined in the reference, based on the reference strain used in the study defining the epitope. On occasions when only the position numbers and not the actual peptide sequence were specified in the original publication, we tried to fill in the peptide sequence based on the position numbers and reference strain. If the sequences were numbered inaccurately by the primary authors, or if we made a mistake in this process, we may have misrepresented the binding site's amino acid sequence. Because of this uncertainty, epitopes that were not explicitly written in the primary publication, that we determined by looking up the reference strain and the numbered location, are followed by a question mark in the table.

Epitope name: If the epitope has a name attributed by the publication, it is recorded here, e.g. "SL9".

Subtype: The subtype under study, if specified in the primary publication; this is generally not specified for B subtype.

Immunogen: The antigenic stimulus of the CTL response. Often this is an HIV-1 infection. If a vaccine was used as the original antigenic stimulation, not a natural infection, this is noted, and additional information about the vaccine antigen is provided as available.

Species (MHC): The species responding and MHC or HLA specificity of the epitope.

Donor MHC: The HLA genotype of the individual that responded to the epitope.

Country: The country where the samples were obtained; this is generally not specified if the study was conducted in the United States.

Assay type: Assays used to characterize the response.

Keywords: Keywords are a searchable field for the web interface that is included in the T-cell sections of the printed version to help identify entries of particular interest.

Reference: The primary reference (sometimes two or more directly related studies are included). Details for some of the earlier references are in Part V.

Following the entry for a given CTL epitope brief comments explain the context in which the epitope was studied and what was learned about the epitope in a given study.

II-A-2 HIV protein epitope maps

All HIV CTL epitopes mapped to within a region of 14 amino acids or less are indicated on the HIV protein epitope maps. The location and HLA restriction elements of CTL epitopes are indicated on protein sequences of HXB2. These maps are meant to provide the relative location of defined epitopes on a given protein, but the HXB2 sequence may not actually carry the epitope of interest, as it may vary relative to the sequence for which the epitope was defined. Epitopes with identical boundaries and HLA fields are included in the maps only once. If one laboratory determines HLA presenting molecules at the serotype level (example: A2) and another at the genotype level (example: A*0201) both will be included in the map. MHC specificities are indicative of the host species; when no MHC presenting molecule is defined, the host species is noted.

II-A-3 Alignments

To conserve space, no epitope alignments are provided in this book, but they can be generated using the CTL epitope search tool at `http://www.hiv.lanl.gov/content/immunology`. The master protein sequence alignment files from which the epitope alignments were created are available at our web site at `http://www.hiv.lanl.gov/content/sequence/NEWALIGN/align.html`.

II-B

HIV CTL/CD8+ Epitope Tables

All HIV CTL epitopes are arranged by protein position. The table entries are sorted in a nested way—first by protein, then by HXB2 start location, and finally by HLA presenting molecule. CTL reactions against proteins with undefined epitopes are listed at the end of the protein that stimulated the response.

II-B-1 Gag p17 CTL/CD8+ epitopes

HXB2 Location p17 (1–10)
Author Location Gag
Epitope MGARASVLSG
Subtype CRF01_AE
Immunogen HIV-1 infection
Species (MHC) human
Country Thailand
Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay
Keywords optimal epitope
References Kantakamalakul *et al.* 2006

- T cell responses in CRF01_AE infected individuals from Thailand were studied.
- A single peptide elicited IFN-gamma responses from three subjects and may be an A*1101 binding peptide. It may contain a novel T cell epitope, MGARASVLSG.

HXB2 Location p17 (5–13)
Author Location Gag (5–13 SUMA)
Epitope ASVLSGGEL
Epitope name Gag AL9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Donor MHC A*1103, A*2402, B*1402, B*1501, Cw*0802
Country United States
Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay
Keywords dynamics, acute/early infection, characterizing CD8+ T cells
References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape,within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T-cell counts through 7 years of followup. In contrast to more rapid progressors WEAU and BORI, SUMA had a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only 4 epitopes acquired escape mutations in SUMA over time, and this was 1 of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

HXB2 Location p17 (5–15)
Author Location Gag (5–15)
Epitope ASILRGGKLDK
Subtype C
Immunogen HIV-1 infection
Species (MHC) human
Country India
Assay type CD8 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords subtype comparisons
References Kaushik *et al.* 2005

- T cell responses to Gag consensus C peptides were studied in C-infected patients from India. CD8+ responses were stronger and broader than CD4+ responses. IFN-γ response was higher in both CD8+ and CD4+ T cells than corresponding IL-2 response, that was detectable only in CD4+ T cells.
- 1/25 patients responded to this peptide (IFN-γ CD8+ response). An IL-2 response was not detectable.

HXB2 Location p17 (5–19)
Author Location p17 (5–19)
Epitope ASVLSGGELDRWEKI
Epitope name AI14
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country United States
Assay type CD8 T-cell Elispot - IFNγ
Keywords binding affinity, subtype comparisons, acute/early infection
References Malhotra *et al.* 2007b

- T-cell responses to clade B Gag peptides were tested using sequences based on consensus (CON), most recent common ancestor (ANC) and center of tree (COT); as well as CON sequences from clade A, clade C and M-group Gag. It was found that Gag-specific cross-clade T-cell IFN-gamma responses are detectable during primary infection, and there was no significant difference in breadth or magnitude of responses with the

CTL CD8+

different peptide sets. While several epitopes in low diversity domains are invariant across clades, other recognized variants are seen outside HLA anchor positions. T-cell immunity often tolerates conservative or semi-conservative amino acid substitutions but changes presumed to be in TCR contact sites may abrogate epitope recognition.
- This peptide, ASVLSGGELDRWEKI contains the CON clade-B putative epitope AI14. No cross-recognition of variants was seen across clades or intra-clade central sequences. Variant ASVLSGGkLDaWEKI was seen in clade A and M-group; variant ASiLrGGkLDkWEKI in clade C; ASVLSGGkLDkWEKI in clade-B ANC; and variant ASVLSGGELDkWEKI in clade-B COT.

HXB2 Location p17 (6–15)
Author Location Gag (Henan isolate)
Epitope SVLSGGQLDR
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A11)
Country China
Assay type CD8 T-cell Elispot - IFNγ
References Gong *et al.* 2006
- CTL responses were studied in treated and untreated donors from China, using Gag peptides from Henan isolate. All peptides were predicted to have A2 or A11 restriction (two of the most prominent alleles in Chinese population) and HLA restriction was further analyzed by CTL recognition in patients carrying corresponding allele. Among treated donors, HLA-A2 donors had higher CTL response than than HLA-A11 donors. Chronically infected untreated individuals had higher magnitude of CTL response than treated ones.

HXB2 Location p17 (8–18)
Author Location Gag (8–18)
Epitope LSGGELDRWEK
Epitope name Gag 1.2
Immunogen vaccine
Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* B clade *HIV component:* Env, Gag, Protease, Rev, RT, Tat, Vpu
Species (MHC) macaque
Assay type T-cell Elispot, Intracellular cytokine staining
Keywords subtype comparisons, variant cross-recognition or cross-neutralization, memory cells
References Amara *et al.* 2005
- A clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02_AG consensus Gag in macaques. The activity was better conserved for CD8 than CD4 T cells.
- All 5 CD8 and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation. The similar reported human epitope in this case is GELDRWEKI. HLA restriction: B*4002, B62
- Conservation across other clades: none. The form that is most common in CRF02, LSGGkLDaWEK, does not cross-react with the B clade elicited response.

HXB2 Location p17 (9–23)
Author Location
Epitope SGGELDRWEKIRLRP
Immunogen HIV-1 infection
Species (MHC) human (B44, B60)
Donor MHC A11, A2, B44, B60; A2, A24, B15, B40; A11, A2, B60, B7
Country Australia
Assay type proliferation, CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Dyer *et al.* 2008
- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.
- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- Peptide 3 (NIH ARRP Cat# 7874), SGGELDRWEKIRLRP, which contains epitopes restricted by HLA-B44 and -B60 in different patients elicited the following CTL responses: (1) > 1000 sfu/million PBMC for 22+ years in a living non-progressor (2) 18+ years in another living non-progressor and (3) 12+ years in a low-viremic non-progressor who succumbed to a non-AIDS death.

HXB2 Location p17 (11–19)
Author Location
Epitope GELDRWEKI
Epitope name Gag-GI9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B*4002)
Donor MHC 01RCH46: A*0201, A*0217, B*0801, B*4002, Cw*0303, Cw*0701
Keywords HAART, ART
References Sabbaj *et al.* 2003
- This study monitored epitope responses in HIV-1 infected minority women living in the United States.
- 24 epitopes were described – 8 were novel, 8 used new restricting elements but were previously defined epitopes, and 8 were previously described.
- Serial peptide truncations were used to define optimal epitopes for CTL cell lines isolated from 12 individuals, assayed by a Cr-release.
- This epitope was newly defined in this study.
- Patient 01RCH46 was Hispanic, on HAART, and had a viral load of 21000 and CD4 count of 623 – she also recognized KETINEEAA p24(70-78), HLA B*4002, and TAFTIPSI, RT(128-135), HLA A*0217.
- Among HIV+ individuals who carried HLA B40, 2/5 (40%) recognized this epitope.

HXB2 Location p17 (11–19)

Author Location p17 (11–19)
Epitope GELDRWEKI
Immunogen HIV-1 infection
Species (MHC) human (B*4002)
Keywords optimal epitope
References Llano *et al.* 2009

HXB2 Location p17 (11–19)
Author Location p17 (11–19)
Epitope GELDRWEKI
Epitope name GI9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B40)
Donor MHC A*30, B*18, B*40, Cw*02, Cw*05
Country United States
Assay type CD8 T-cell Elispot - IFNγ
Keywords responses in children, mother-to-infant transmission, escape, acute/early infection, viral fitness and reversion
References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness.
- Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- The escape variant geldrwKki was detected in 10/10 maternal clones from a B40-positive mother, but was absent in all sequences from her B40-negative infant, sampled at months 2, 4, and 11, suggesting either transmission of a minority wild-type variant, or rapid reversion in the absence of continued CTL pressure.
- geldrwKki elicted lower responder cell frequencies than GELDRWEKI.

HXB2 Location p17 (11–19)
Author Location p15
Epitope GELDRWEKI
Epitope name B40-GI9(p15)
Immunogen HIV-1 infection
Species (MHC) human (B40)
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, early-expressed proteins
References Altfeld *et al.* 2006

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

HXB2 Location p17 (11–19)
Author Location p17
Epitope GQLDRWEKI
Epitope name GI9(p17)
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country China
Assay type CD8 T-cell Elispot - IFNγ
Keywords variant cross-recognition or cross-neutralization
References Zhai *et al.* 2008

- 49 ART-naive chronically HIV-1 infected Chinese subjects' CTLs were tested with 413 OLPs in IFN-gamma assays, determining optimal epitopes specific for Chinese Clade B HIV-1 sequences.
- An inverse correlation was found between CTL response and viral load.
- Targeted peptides have lower entropy than peptides that are not CTL targeted. This correlation is independent of HLA-restriction.
- Author defined epitope GQLDRWEKI elicited an immune response as part of peptide SGGQLDRWEKIRLRPGGK. This epitope differs from the previously described epitope, GELDRWEKI, at 1 residue, GqLDRWEKI.
- 1 of the 20 HLA-B40 carriers responded to GqLDRWEKI-containing peptide with a magnitude of CTL response of 50 SFC/million PBMC (author communication and Fig.1).

HXB2 Location p17 (11–22)
Author Location Gag
Epitope GKLDSWEKIRLR
Subtype A, CRF02_AG, CRF01_AE
Immunogen HIV-1 infection
Species (MHC) human
Country Cote D'Ivoire
Assay type CD8 T-cell Elispot - IFNγ, Other
Keywords subtype comparisons
References Aidoo *et al.* 2008

- Factors affecting cross-subtype immunity were evaluated by west Cote d'Ivoire subjects' INF-gamma ELISpot responses to OLPs from a CRF02_AG candidate vaccine, a west Kenyan subtype A virus and a Thai CRF01_AE sequence. 15 test subject sequences were primarily CRF02_AG or CRF02_AG-like, but also pure subtypes A and D. Cross-reactive responses to Gag as well as Env peptides were seen, though the response magnitude to Env was lower, perhaps due to its greater sequence variation.
- 1 subject responded to peptide GKLDSWEKIRLR from subtypes CRF02_AG and A and to peptide GKLDaWEKIRLR from subtype CRF01_AE.

Epitope ELDRWEKIRL
Subtype B, C
Immunogen HIV-1 infection
Species (MHC) human (B63)
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Frahm *et al.* 2005

- HLA-B63-positive subjects were shown to be able to generate CTL responses early in acute HIV infection and to control HIV replication in the absence of antiretroviral treatment. Since HLA-B63 shares the epitope binding motif of HLA-B57 and -B58, it was shown that HLA-B63-positive individuals mounted CTL responses to previously identified B57-restricted epitopes, as well as novel, B63-restricted epitopes. Moreover, these novel B63-restricted epitopes can also be presented by HLA-B57 and -B58.
- This is a putative HLA B63 epitope containing the B58 supertype binding motif embedded in a reactive peptide. There is no evidence for B57/B58 cross-presentation of this epitope.

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.

- Responses to this peptide were detected in 19% of the study subjects, and it was one of the 25 most frequently recognized peptides.

References Balamurugan *et al.* 2008

- To check whether unsuccessful vaccines may interfere with normal patient immune response,2 subjects were followed. The first, 00015, was seronegative while receiving vaccination, but later contracted infection. The second, 00016, had temporary sexual contact with subject 00015 and showed symptoms of disease 2 weeks before him. Without treatment, both reached low chronic viremic levels, and showed similar magnitude of immune response.
- Similar immune pressure was seen on viral sequences in both patients, over time in Gag, Pol, Nef.
- Data suggest that the vaccine failed to prime subject 00015 against HIV infection, but it did not impair ability to naturally contain viremia in comparison with infecting subject 00016.
- CTL immune response to consensus sequence EKIRLRPG-GKKKYKL was elicited in 2 subjects. Consensus epitopes of subject 0015 and of subject 0016 were the same as Clade B consensus.

Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords binding affinity, immunodominance
References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, EKIRLRPGGKKKYKLKHI, had an overall frequency of recognition of 16.7% - 22% AA, 15.4% C, 15.9% H, 4.8% WI.

Country United Kingdom
Assay type CD8 T-cell Elispot - IFNγ, HLA binding
Keywords escape, acute/early infection, variant cross-recognition or cross-neutralization
References Milicic *et al.* 2005
- CTL responses and escape were analyzed in 4 homosexual couples where blood samples were available within weeks of estimated transmission. CTL escape variants were often transmitted. When the recipient had the same HLA type as the donor, CTL escape variants prevented a CTL response to those epitopes in the recipient. Even when the HLA alleles were different in the transmitting couple, a single escape mutation in one epitope can abolish CTL recognition of an overlapping epitope of distinct restriction in the recipient.
- A*0301 epitopes RLRPGGKKK and KIRLRPGGK, and B*0801 epitope GGKKKYRL, overlap. In 1 donor, the transmitted virus carried the escape form for 2 of these epitopes. The double substitution kirlrpggR results in escape from response in the donor. Similarly, the double substitution ggRkkyKl results in escape for this epitope.
- The escape mutation kirlrpggR in this epitope resulted in 74% reduction in HLA binding affinity. The other variant tested, kirlrQggR, resulted in 90% reduction.

Keywords dynamics, supervised treatment interruptions (STI), immunodominance, acute/early infection
References Yu *et al.* 2002a

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- 8/14 HLA-A3 positive individuals had detectable A3-restricted responses during acute infection. Only 5/15 of HLA-A3 epitopes tested were targeted during acute infection. 7/8 individuals with acute responses had specific responses for this epitope.
- KIRLRPGGK and RLRPGGKKK were the most commonly recognized HLA-A3 epitopes during acute infection, after 1 year of treatment, and after STI. RLRPGGKKK was immunodominant.

References Geels *et al.* 2003

- Both stable potential epitopes and epitopes with escape mutations were found in a patient with increasing viral load over a time period of 4 years. Fixation of escape mutations occured sequentially and correlated with the rise in viral load and with the increased number of productively infected cells.
- This is one of 17 potential epitopes from this individual, defined based on previously identified epitopes presented by appropriate HLA molecules. Full length genome sequence did not reveal changes in time in any of these epitopes over a four year period. Peptide pools initially revealed very little response to these epotopes, but this increased over time.

References Allen *et al.* 2004

- KK9 and RK9 overlap, are presented by HLA-A3, and are frequently immunodominant and involved in acute-phase primary responses. A mutation in the C-terminal flanking residue of KK9 (K to Q) (kirlrpkkg-Q) inhibits processing of the immunodominant gag KK9 epitope, resulting in rapid decline in the KK9 specific CD8+ T-cell response. At the same time it abrogates the response to RK9 through the embedded mutation rlrpggkQk. Transmission of this mutation to patients expressing HLA-A3 prevents acute-phase response to these epitopes, although the mutation can eventually revert to wild-type allowing a delayed response to the epitope.

Assay type CD8 T-cell Elispot - IFNγ
Keywords responses in children, mother-to-infant transmission, escape, acute/early infection, viral fitness and reversion
References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness.
- Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- The escape variant kirlrpggR was present in 10/10 clones from an A3+ mother, was transmitted to her infant,and present in 10/10 clones at months 2 and 4, but decreased to 0/10 clones by 15 months of age in her A3- child.

Immunogen HIV-1 infection
Species (MHC) human (A3)
Donor MHC A3, A32, B62, B8, Cw3
Country Netherlands
Assay type Other
Keywords subtype comparisons, computational epitope prediction, superinfection
References Kozaczynska *et al.* 2007

- The influence of superinfection upon changes in HIV-1 strains was studied in a triple infected subject. While continuous expression of all three strains was observed, the LTR promoters of subtype AE had highest activity of all 3 strains, and subtype B2 had the lowest. Env-V3 sequences were present in higher numbers in strains B2 and CRF01_AE. Recombination was seen between viruses B1/B2 in gag and vpr genes.
- This HLA-A03 restricted epitope, KIRLRPGGK, is the dominant gag epitope in Caucasians and varied to KIRLRPGGr or KIRLRPGGs. Mutant KIRLRPGkK was found at 42% in strain B1 after 4 years while mutant KIRLRPGGs was found in 100% of B2 after 3 years. Though the infecting variant in CRF01_AE was KIRLRPGGq, no changes were seen in it with time.

Keywords supervised treatment interruptions (STI), variant cross-recognition or cross-neutralization, characterizing CD8+ T cells, drug resistance
References Daucher *et al.* 2008

- A detailed analysis of 6 chronically infected patients' CTL responses to autologous virus was performed after ART and SIT (structured interruption of therapy). Qualitative responses including degranulation and production of IFN-gamma, MIP-1beta, TNF-alpha, IL-2, but not memory CD27, CD45RO and CD57 T cells correlated with extended low plasma viremia. Frequency and breadth of CTL response as well as immune escape did not influence virological outcome.
- One patient exhibited drug resistance mutations K170R (to NNRTI efavirenz) and D76N, K70R (to NRTIs).
- Autologous epitopes were preferentially recognized over optimal, consensus sequences.
- Patients with favorable virological outcomes demonstrated CTL recognition within multiple, conserved regions of Gag and Nef.
- Patients with poor virological outcomes recognized optimal epitopes with much lower frequencies, though this was not significant.
- HLA-A3-restricted epitope, KIRLRPGGK, elicited a response in 3 patients and is found in Gag immunodominant regions WEKIRLRPGGKKKYKL, WEKIRLRPGGKKKYK or LDRWEKIRLRPGGKKKYKL. The autologous sequence in one patient was KIRLRPGGr.
- In a patient who had one of the lowest viremias, the highest frequency of CTL response was to 2 immunodominant regions in Gag containing epitopes KK9, RK9 (RLRPGGKKK) and p17 RPGGKKKYK.

References Altfeld *et al.* 2002a

- An HIV+ individual given acute ARV and undergoing STI developed a strong CTL immune response, but despite this was shown to be superinfected with second B clade virus. Some epitope variants of the second infecting virus were resistant to the initial CTL response. This epitope did not vary, although the response declined over time. The authors suggest this might be due to a downstream Arg -> Thr substitution at C+2 that may impair processing.

References Asquith *et al.* 2006

- In order to reconcile apparent conflicts between a CTL-protective role as suggested by HLA-1 alleles associated with different rates of progression to AIDS, and a CTL non-protective role as suggested by the fact that virus clearance following ART is not impaired in advanced AIDS, a model is made that quantifies the efficiency of HIV-1-specific CTLs in vivo. As a surrogate for the actual rate of CTL-killing of infected cells, the model rests on calculating virus escape rate for an epitope and subtracting its reversion rate upon transmission to a non-restricting HLA bearing host. It is shown that CTLs recognizing a single epitope kill only 2% of productively infected CD4+ cells. The rate of CTL lysis was found to be significantly faster during primary infection than in chronic infection. However, the authors suggest that small differences in CTL lysis rate can translate into large differences in terms of absolute numbers of infected cells killed, which are likely to be clinically relevant.
- The best estimate escape rate for this epitope, KIRLRPGGK, was 0.002 (SE 0.006), and best estimate reversion rate was 0/day with a SE of 0.
- The variant K26R confers escape in A*0301+ individuals. On transmission to an HLA A*0301-negative recipient, the mutation did not revert to wild type over a period of 1 year.

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

CTL CD8+

- Three distinct HLA alleles known to alter the rate of AIDS progression were studied. B*57-mediated protection occurs early in infection and the protective effect of this allele subsides after CD4 cell count drops. In contrast, B*27 shows no protection against progression to CD4<200, but rather delays progression to an AIDS-defining illness after the CD4 counts have dropped. B*35-mediated rapid progression to AIDS is probably a function of early decline in CD4 counts.
- KK10 escape occurs late and was shown to precede a sharp increase in viral load. The authors hypothesize the B27 benefit may arise due to enduring HLA restriction after escape from many other allotype responses has occurred.

Immunogen HIV-1 infection
Species (MHC) human (B27)
Donor MHC A26, B27
Assay type CD8 T-cell Elispot - IFNγ
Keywords responses in children, rate of progression, immunodominance, escape
References Feeney *et al.* 2004

- Viral load in a perinatally infected child remained low until emergence of an escape variant (kTwiilglnk) in the immunodominant CTL epitope KRWIILGLNK when the child was 7.4 years old. The emergence of this escape mutation was followed by an increase in viremia and an increase in the number of targeted CTL epitopes, measured again when the child was 9.2 years old. A low level response to IK9 was the only other epitope recognized prior to the loss of immune control and broadening of the response, and was detected in the 7.4 year sample.

Epitope name RK9
Subtype A1
Immunogen HIV-1 infection
Species (MHC) human (A*03)
Country Kenya
Keywords epitope processing, escape
References Peters *et al.* 2008a

- Gag sequences from 468 HIV-1 positive sex workers from the Kenyan Pumwani cohort were analyzed to bioinformatically identify positively selected residues that could be related to antigen processing. Mutation effects on disease progression were followed by mean CD4 counts. This method is also one way of identifying potential CTL epitopes and classifying them.
- A Gag positive selection map was generated and sites were classified as beneficial or harmful to HIV. They were correlated to antigen processing (proteasomal cleavage), antigen presentation (TAP transport efficiency) and T-cell receptor binding.
- p17 and p24's structural constraints limited their diversity, while p7-p1-p6 showed a higher average entropy.
- HLA-A*03-restricted epitope, RLRPGGKKK, contained a positive selection at K28Q i.e. RLRPGGKKq (RQ9), a probable proteasome escape variant. 2 possible TAP escape mutants were seen at R20Q to qLRPGGKKK (QK9) and K28Q to RLRPGGKKq (RQ9 - see above), both of which had decreased TAP binding affinity. Mutant RQ9 is also suspected to reduce recognition of peptide to HLA-A*0301.

Keywords HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-A*03-associated substitution within optimally defined epitope RLRPGGKKK is at position K9, RLRPGGKKk.

Epitope RLRPGGKKK
Immunogen HIV-1 infection
Species (MHC) human (A*0301)
Keywords acute/early infection
References Wilson *et al.* 2000a

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWIILGGLNK.
- The subject with A*0201 had a moderately strong response to SLYNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

- CTL responses and escape were analyzed in 4 homosexual couples where blood samples were available within weeks of estimated transmission. CTL escape variants were often transmitted. When the recipient had the same HLA type as the donor, CTL escape variants prevented a CTL response to those epitopes in the recipient. Even when the HLA alleles were different in the transmitting couple, a single escape mutation in one epitope can abolish CTL recognition of an overlapping epitope of distinct restriction in the recipient.
- Certain escape mutations in RLRPGGKKK, rlrpggkkQ, rlrpggkkR and rlrpggkkT, resulted in nearly complete reduction in binding affinity for A*0301. The form that was transmitted in one of the donor pairs was rlrpggRkk, and it binds to A*0301 with comparable affinity to RLRPGGKKK. However, an escape variant was on the rise in the donor near the time of transmission, rlrpggRkT, which eventually came to fixation in the donor, illustrating the importance of the timing of transmission regarding which variant is transmitted.
- A*0301 epitopes RLRPGGKKK and KIRLRPGGK, and B*0801 epitope GGKKKYRL, overlap. In 1 donor, the transmitted virus carried the escape form for 2 of these epitopes. The double substitution kirlrpggR results in escape from response in the donor. Similarly, the double substitution ggRkkyKl results in escape for this epitope.

References Asquith *et al.* 2006

- In order to reconcile apparent conflicts between a CTL-protective role as suggested by HLA-1 alleles associated with different rates of progression to AIDS, and a CTL non-protective role as suggested by the fact that virus clearance following ART is not impaired in advanced AIDS, a model is made that quantifies the efficiency of HIV-1-specific CTLs in vivo. As a surrogate for the actual rate of CTL-killing of infected cells, the model rests on calculating virus escape rate for an epitope and subtracting its reversion rate upon transmission to a non-restricting HLA bearing host. It is shown that CTLs recognizing a single epitope kill only 2% of productively infected CD4+ cells. The rate of CTL lysis was found to be significantly faster during primary infection than in chronic infection. However, the authors suggest that small differences in CTL lysis rate can translate into large differences in terms of absolute numbers of infected cells killed, which are likely to be clinically relevant.
- The best estimate of escape rate for this epitope, RLRPGGKKK, was found to be 0.032/day, with SE of 0.008.
- The K28T substitution conferred escape from CTL responses of both the RLRPGGKKK and GGKKKYRL epitopes.

Keywords rate of progression, TCR usage, variant cross-recognition or cross-neutralization, characterizing CD8+ T cells
References Turnbull *et al.* 2006

- Functional cross-reactivity of CD8 responses to HIV-1 epitopes restricted by different HLA-alleles was analyzed. It was shown that epitope-specific responses with the most efficient cross-recognition were strongly associated with delayed disease progression. Variant-cross recognition efficiency was linked to the dominant TCRs used for epitope recognition. Epitopes restricted by the same HLA-allele did not show similar variant cross-recognition efficiency, suggesting that the rate of disease progression might be associated with the quality of responses to certain critical epitopes.
- This epitope, A3-RLR (that has no assoication with accelerated or delayed progression to AIDS) and its natural variants are not cross-recognized. Its alanine-substituted variants were extremely inconsistent between individuals showing very efficient or poor cross-reactivity.

- IFNgamma T-cell responses in breast milk of 5 HIV-1 infected women from the US and 6 from Zambia were tested with using Elispot. 11/11 women responded to Gag, 8/11 responded to Pol, 7/11 women to Nef, and 2/5 women to Env peptide pools. These responses were shown to be primarily due to CD8+ T-cells in one woman, and another woman had cytolytic responses measured by Cr-release.
- T-cells in breast milk from a volunteer who was HLA A3, A11, B35, B51 induced IFNgamma after stimulation with a peptide that carries known A3 epitope RLRPGGKKK.
- The frequencies of responses in the two compartments differed, and 2/4 women that responded to epitopes in Nef 101-205 and Pol 601-710 showed responses in breast milk but no detectable responses in peripheral blood cells.

Assay type CD8 T-cell Elispot - IFNγ
Keywords acute/early infection, early-expressed proteins
References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- This epitope was recognized in four individuals during early infection, each time presented by A3.
- All HIV-1 proteins except Vpu were recognized, and responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Country Netherlands
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, escape
References Geels *et al.* 2003

- Both stable potential epitopes and epitopes with escape mutations were found in a patient with increasing viral load over a time period of 4 years. Fixation of escape mutations occured sequentially and correlated with the rise in viral load and with the increased number of productively infected cells.
- This is one of 5 epitopes from this individual that varied over time where the internal mutations became fixed; 4/5 epitopes (all except p17 RLRPGGKKK, this eptiope) showed a dramatic decrease in CTL activity against the wild type epitope as the mutation arose. The rlrpggkkR variant was found at 47 and 120 months post-seroconversion.

Author Location Gag
Epitope RLRPGGKKK
Immunogen HIV-1 infection
Species (MHC) human (A3)
Country Netherlands
Assay type CD8 T-cell Elispot - IFNγ
Keywords HIV exposed persistently seronegative (HEPS)
References Koning *et al.* 2004

- A high-risk seronegative group of 29 homosexual men showed reduced cellular in vitro susceptibility for HIV infection and enhanced production of RANTES compared to 15 men who went on to seroconvert. Significantly higher frequencies of HLA A*11, A*31 and Cw*15 were also found in the high risk seronegative men. Both groups of men had low frequencies of HIV-1 specific CD8+ T-cells, which may signify exposure more than protection from infection.

CTL CD8+

- 0/5 HLA A3+ infection-resistant men, and 0/3 pre-seroconversion men who went on to become infected, reacted to this epitope.

HXB2 Location p17 (20–28)

Country United States
Assay type CD8 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords immunodominance, escape, acute/early infection, characterizing CD8+ T cells, viral fitness and reversion
References Allen *et al.* 2004

- KK9 and RK9 overlap, are presented by HLA-A3, and are frequently immunodominant and involved in acute-phase primary responses. A mutation in the C-terminal flanking residue of KK9 (K to Q) (kirlrpkkg-Q) inhibits processing of the immunodominant gag KK9 epitope, resulting in rapid decline in the KK9 specific CD8+ T-cell response. At the same time it abrogates the response to RK9 through the embedded mutation rlrpggkQk. Transmission of this mutation to patients expressing HLA-A3 prevents acute-phase response to these epitopes, although the mutation can eventually revert to wild-type allowing a delayed response to the epitope.

Immunogen HIV-1 infection
Species (MHC) human (A3)
Country United States
Assay type CD8 T-cell Elispot - IFNγ
Keywords binding affinity, subtype comparisons, acute/early infection
References Malhotra *et al.* 2007b

- T-cell responses to clade B Gag peptides were tested using sequences based on consensus (CON), most recent common ancestor (ANC) and center of tree (COT); as well as CON sequences from clade A, clade C and M-group Gag. It was found that Gag-specific cross-clade T-cell IFN-gamma responses are detectable during primary infection, and there was no significant difference in breadth or magnitude of responses with the different peptide sets. While several epitopes in low diversity domains are invariant across clades, other recognized variants are seen outside HLA anchor positions. T-cell immunity often tolerates conservative or semi-conservative amino acid substitutions but changes presumed to be in TCR contact sites may abrogate epitope recognition.
- Epitope sequences for this eptiope, RK9 are invariant between CON B, COT B, ANC B and M-group. Cross-recognition is seen with both C- and A-clades. Anchor residues are at positions 2 and 9; while the C-clade variant contains a change at position 9 to RLRPGGKKh. Typically, magnitude and avidity of binding for T-cell responses were much lower to the C-clade variant. HLA-A03 restriction was inferred based on 5 subjects possessing appropriate HLA class I allele and prior publication.

Keywords characterizing CD8+ T cells
References Streeck *et al.* 2008a

- T-cells were studied for exhaustion and dysfunction in chronic HIV infection. Polyfunctionality of CTL immune response to HIV-1 decreased with persistence of antigen presence over time in chronic infection. CTL exhaustion can thus be halted by reduction in viral antigen load - either by ART or through escape mutations.
- PD-1, marker for activation and apoptosis increases over time, but it decreases when epitope mutations develop. CD127 however, is not impacted by viral escape.

- 3 untreated patients with HIV epitope RLRPGGKKK variations to RLRPGGKKr, RLRPGGKKt and RLRPGGKKq after 350, 405 and 68 days. In addition, a 4th patient carried variant RLRqGGrKK which did not alter in time.
- Surprisingly, after first testing, the epitope RLRPGGKKK went from monofunctional to dual- and triple-functional in the response it was able to elicit. Previously published HLA-restriction for RK9 is HLA-A3.

Keywords supervised treatment interruptions (STI), immunodominance, variant cross-recognition or cross-neutralization, characterizing CD8+ T cells, drug resistance
References Daucher *et al.* 2008

- A detailed analysis of 6 chronically infected patients' CTL responses to autologous virus was performed after ART and SIT (structured interruption of therapy). Qualitative responses including degranulation and production of IFN-gamma, MIP-1beta, TNF-alpha, IL-2, but not memory CD27, CD45RO and CD57 T cells correlated with extended low plasma viremia. Frequency and breadth of CTL response as well as immune escape did not influence virological outcome.
- One patient exhibited drug resistance mutations K170R (to NNRTI efavirenz) and D76N, K70R (to NRTIs).
- Autologous epitopes were preferentially recognized over optimal, consensus sequences.
- Patients with favorable virological outcomes demonstrated CTL recognition within multiple, conserved regions of Gag and Nef.
- Patients with poor virological outcomes recognized optimal epitopes with much lower frequencies, though this was not significant.
- HLA-A3 and -B7-restricted epitope, RLRPGGKKK, elicited a response in 3 patients and is found in Gag immunodominant regions WEKIRLRPGGKKKYKL, WEKIRLRPGGKKKYK or LDRWEKIRLRPGGKKKYKL. The autologous sequence in one patient was RLRPGGrKr.

- In a patient who had one of the lowest viremias, the highest frequency of CTL response was to 2 immunodominant regions in Gag containing epitopes KK9 (KIRLRPGGK), RK9 (RLRPGGKKK) and p17 RPGGKKKYK.

Assay type CD8 T-cell Elispot - IFNγ
Keywords responses in children, mother-to-infant transmission, escape, acute/early infection, viral fitness and reversion
References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness.
- Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- RLRPGGKKKY was recognized in 2 mothers, and is an A*30 epitope. The variant RLRPGGKKqY was found in 9/10 of 1 mother's sequences. This form was transmitted to her child, and 10/10 clones were this variant at months 2 and 6 in the infant; by month 12, 9/10 were RLRPGGKKqY. RLRPGGKKrY was the form found in the other mother. The variant gradually diminished in frequency in her child, 10/10 sequences at 2 months, 9/10 at 4 months, and 6/10 at 12 months.

CTL CD8+

Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric T-cell cytokine assay
Keywords escape, variant cross-recognition or cross-neutralization
References Koibuchi *et al.* 2005

- HIV-1-specific CD8 T-cell responses were persistent in the chronic phase of HIV-1 infection, although the responses to some of the epitopes declined despite the persistence of the targeted sequences in vivo. Only 4/14 epitopes were potential CTL escape variants, although strong responses to these epitopes persisted for 6 years. This indicates limited viral evolution within targeted CD8 T-cell epitopes during the chronic phase of infection.
- The RY10 variant RLRPGGrKKY was the only form of the epitope detected over a 5 year time period in this person. Elispot reactions were stronger to the autologous form than to RLRPGGKKKY, the B clade consensus form.

Keywords HAART, ART, immunodominance, TCR usage, memory cells
References Weekes *et al.* 2006

- The effect of HAART on the population size, phenotype and function of HIV- and HCMV-specific CTL clones was analyzed. It was determined that the clonal composition of gag and env HIV-specific CD8 T-cells did not change after HAART. Following HAART, the size of immunodominant HIV-specific CD8 T-cell clones was found to diminish even with the relative preservation of functional memory responses. Maintainance of such strong functional responses implied the preferential loss of HIV-specific cells that have reduced cloning efficiency in vitro. HCMV-specific CTL clones had different kinetics and phenotypes than HIV-specific CTL clones in the same subject.

- In order to reconcile apparent conflicts between a CTL-protective role as suggested by HLA-1 alleles associated with different rates of progression to AIDS, and a CTL non-protective role as suggested by the fact that virus clearance following ART is not impaired in advanced AIDS, a model is made that quantifies the efficiency of HIV-1-specific CTLs in vivo. As a surrogate for the actual rate of CTL-killing of infected cells, the model rests on calculating virus escape rate for an epitope and subtracting its reversion rate upon transmission to a non-restricting HLA bearing host. It is shown that CTLs recognizing a single epitope kill only 2% of productively infected CD4+ cells. The rate of CTL lysis was found to be significantly faster during primary infection than in chronic infection. However, the authors suggest that small differences in CTL lysis rate can translate into large differences in terms of absolute numbers of infected cells killed, which are likely to be clinically relevant.
- The best estimate of escape rate for this epitope, LRPGGKKKYKLKHIV, was found to be -0.001/day (upper bound on rate of escape = 0.085), with SE of 0.003.
- In the subject studied, K26R grew out steadily to 95% frequency, but then there was a progressive re-emergence of the wild type. If data from all time points were fitted, then the mutant actually had a negative growth rate because it was eventually out-competed by the wild type.

- 56 ART-naive subjects were studied to assess whether T-cell responses to Gag and Nef are biased towards infecting subtype recognition, in a setting of epidemic consisting of subtypes A,C and D and their recombinant forms. The infecting subtype was determined by multi-region hybridization assay. Overlapping 15-mer isolate-based Gag and Nef peptide sets representative of local subtypes were used. The best recognized epitope variant in terms of magnitude and breadth corresponded to infecting subtype, in this case usually type-C. Hot spots of CTL recognition in Gag were in p24, p17 and p15; hotspots against Nef were in its central, conserved region.
- Epitope variants RPGGKKhY, RPGGKKkY and RPGGKKqY were studied as peptide sequences EKIRL-RPGGKKhY-ML (subtype C), EKIRL-RPGGKKkY-RL (subtypes A and D) and EKIRL-RPGGKKqY-RM with 12.5% responders. Subtype A was best recognized. Associated HLAs frequently expressed within the studied cohort are listed in the study as B07, B42.

Keywords supervised treatment interruptions (STI), immunodominance, variant cross-recognition or cross-neutralization, characterizing CD8+ T cells, drug resistance
References Daucher *et al.* 2008

- A detailed analysis of 6 chronically infected patients' CTL responses to autologous virus was performed after ART and SIT (structured interruption of therapy). Qualitative responses including degranulation and production of IFN-gamma, MIP-1beta, TNF-alpha, IL-2, but not memory CD27, CD45RO and CD57 T cells correlated with extended low plasma viremia. Frequency and breadth of CTL response as well as immune escape did not influence virological outcome.
- One patient exhibited drug resistance mutations K170R (to NNRTI efavirenz) and D76N, K70R (to NRTIs).
- Autologous epitopes were preferentially recognized over optimal, consensus sequences.
- Patients with favorable virological outcomes demonstrated CTL recognition within multiple, conserved regions of Gag and Nef.
- Patients with poor virological outcomes recognized optimal epitopes with much lower frequencies, though this was not significant.
- HLA-B7-restricted epitope, RPGGKKKYK, elicited a response in 3 patients and is found in Gag immunodominant regions WEKIRLRPGGKKKYKL, WEKIRLRPGGKKKYK or LDRWEKIRLRPGGKKKYKL. The autologous sequence

in one patient was RPGGKKKrYK and in the other 2 was RPGGKKKKYr.
- In a patient who had one of the lowest viremias, the highest frequency of CTL response was to 2 immunodominant regions in Gag containing epitopes KK9 (KIRLRPGGK), RK9 (RLRPGGKKK) and this epitope p17 RPGGKKKYK.

Keywords rate of progression, immunodominance
References Geldmacher *et al.* 2007b
- The objectives of this study were to find antiviral epitopic determinants of Gag HIV-specific CTL response and to find 'host HLA-CTL response' correlations. By studying 56 ART-naive subjects including low viral load (LVL) responders, the authors show that subjects expressing the "protective" HLA-B*0702, -B*5801, and -B*8101 have broader Gag epitope recognition which may be abrogated if co-expressed with HLA-B alleles associated with rapid AIDS progression. Also, a negative linear relation was seen between Gag epitope numbers and plasma viral load while a positive relationship was seen with CD4 T-cell count. Finally, LVL subjects recognized specific Gag regions at the N- and C-termini of the protein more often than peptides in the middle of the protein.
- Epitope RPGGKKKYML, presented by HLA-B*0702 and B*4201 is strongly associated with LVL. However, the last position RPGGKKKYMl is highly variable.

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype D Gag. The autologous epitope sequence had an K5N change, RPGGnKKYKL.

Immunogen HIV-1 infection
Species (MHC) human (B*0801)
Donor MHC A*0101, A*0301, B*0801
Assay type CD8 T-cell Elispot - IFNγ, HLA binding
Keywords HAART, ART, escape, viral fitness and reversion
References Asquith *et al.* 2006

- In order to reconcile apparent conflicts between a CTL-protective role as suggested by HLA-1 alleles associated with different rates of progression to AIDS, and a CTL non-protective role as suggested by the fact that virus clearance following ART is not impaired in advanced AIDS, a model is made that quantifies the efficiency of HIV-1-specific CTLs in vivo. As a surrogate for the actual rate of CTL-killing of infected cells, the model rests on calculating virus escape rate for an epitope and subtracting its reversion rate upon transmission to a non-restricting HLA bearing host. It is shown that CTLs recognizing a single epitope kill only 2% of productively infected CD4+ cells. The rate of CTL lysis was found to be significantly faster during primary infection than in chronic infection. However, the authors suggest that small differences in CTL lysis rate can translate into large differences in terms of absolute numbers of infected cells killed, which are likely to be clinically relevant.
- The best estimate of escape rate for this epitope, GGKKKYRL, was found to be 0.032/day, with SE of 0.008.
- The K28T substitution conferred escape from CTL responses of both the RLRPGGKKK and GGKKKYRL epitopes.

Epitope GGKKKYKL
Immunogen
Species (MHC) human (B8)
References Goulder *et al.* 1997g

- The crystal structure of this peptide bound to HLA-B8 was used to predict new epitopes and the consequences of epitope variation.
- The predictions were experimentally confirmed.
- The anchors for HLA-B8 epitopes, as defined by peptide elution data, are P3 (K), P5 (K/R), and P8 (L).
- Structural data suggests that a positive charge at P5 is essential, but that the constraints on P3 may be less severe.
- Small hydrophobic residues at P2 may be favorable for binding.

- A spacious F-pocket favors mid-sized hydrophobic residues in the C-term anchor.

Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons
References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype D Gag. The autologous epitope sequence had an L8M change, GGKKKYKm.

Keywords responses in children, mother-to-infant transmission, escape, characterizing CD8+ T cells, viral fitness and reversion
References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness.
- Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- Variant sequence ggRkkykl was present in 10/10 clones from a B8-positive mother, but decreased to 0/10 clones by 15 months of age in her B8-negative child.
- The variant ggRkkykl was present in 10/10 clones from a B8+ mother, was transmitted to her infant, and present in 10/10 clones at months 2 and 4, but decreased to 0/10 clones by 15 months of age in her B8- child.

Assay type CD8 T-cell Elispot - IFNγ
Keywords escape, immune evasion, viral fitness and reversion, optimal epitope
References Liu *et al.* 2006b

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.
- Gag epitope GGKKKYKf (p17-31F) presumed escape variant was transmitted from a B8 positive donor to a B8 negative recipient. Reversions to GGKKKYKl were found in the recipient.

Epitope name GK9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B*08)
Country Australia, Canada, Germany, United States
Keywords escape, HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-B*08-associated substitution within optimally defined epitope GGKKKYKLK is at positions K3, GGkKKYKLK. GK9 has a very low recognition frequency and rate of escape.

Species (MHC) human (B*0801)
Assay type CD8 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords rate of progression, TCR usage, variant cross-recognition or cross-neutralization, characterizing CD8+ T cells
References Turnbull *et al.* 2006

- Functional cross-reactivity of CD8 responses to HIV-1 epitopes restricted by different HLA-alleles was analyzed. It was shown that epitope-specific responses with the most efficient cross-recognition were strongly associated with delayed disease progression. Variant-cross recognition efficiency was linked to the dominant TCRs used for epitope recognition. Epitopes restricted by the same HLA-allele did not show similar variant cross-recognition efficiency, suggesting that the rate of disease progression might be associated with the quality of responses to certain critical epitopes.
- This epitope, B8-GGK and its alanine-substituted variants are very weakly cross-recognized and reactive.

Assay type CD8 T-cell Elispot - IFNγ, Other
Keywords subtype comparisons, immunodominance
References Geldmacher *et al.* 2007a

- 56 ART-naive subjects were studied to assess whether T-cell responses to Gag and Nef are biased towards infecting subtype recognition, in a setting of epidemic consisting of subtypes A,C and D and their recombinant forms. The infecting subtype was determined by multi-region hybridization assay. Overlapping 15-mer isolate-based Gag and Nef peptide sets representative of local subtypes were used. The best recognized epitope variant in terms of magnitude and breadth corresponded to infecting subtype, in this case usually type-C. Hot spots of CTL recognition in Gag were in p24, p17 and p15; hotspots against Nef were in its central, conserved region.
- Epitope variants hYmLKHiVW, kYrLKHlVW and qYrLKHlVW were studied as peptide sequences GKK-hYmLKHiVW-ASR (subtype C), GKK-kYrLKHlVW-ASR (subtype A) and GKK-qYrLKHlVW-ASR with 21% responders. Subtype C sequences were recognized best. Associated HLA frequently expressed within the studied cohort is listed in the study as A*2301.

Country South Africa
Assay type CD8 T-cell Elispot - IFNγ
Keywords variant cross-recognition or cross-neutralization
References Chopera *et al.* 2008

- Transmission of HIV-1-escape variants from individuals with protective HLA-B*57/-B*5801 alleles to those without these alleles was studied to determine if infection with such replication-deficient mutants offered any advantage to the new host. Dependency between slower rate of disease progression in the newly infected subject and protective genotype of the infecting individual was suggested.

- HLA-A*2301-restricted epitope HYMLKHLVW, within peptide GKKHYMLKHLVWASREL was able to elicit CTL response in 2 wild type virus-carrying subjects.

Assay type CD8 T-cell Elispot - IFNγ
Keywords cross-presentation by different HLA, characterizing CD8+ T cells
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Keywords rate of progression
References Gray *et al.* 2009

- 47 HIV-1 subtype C infected patients were followed longitudinally to determine whether there was a relation between magnitude and breadth of CTL responses in primary, acute infection (measured by IFN-gamma ELISpot) and disease progression (measured as viral load at 12 months). CTL responses to Nef were dominant (targeting 6 epitopic regions), followed by responses to Gag, Pol, Rev, Vpr, Env, Vpu, Vif and finally Tat.
- Known epitope HYMLKHLVW is HLA-A*2301 and -A*2402-restricted. Response to a peptide containing this epitope was detected in a rapid progressor 12 weeks post-infection.

Immunogen peptide-HLA interaction
Species (MHC) human (A*2402)
Assay type Tetramer binding
Keywords binding affinity
References Gillespie *et al.* 2007
- MHC can exert a protective effect on HIV-1 disease progression by the interaction of MHC Class I molecules with Killer Inhibitory Receptors (KIR) of the innate immune system. Here, KIR3DS1, a putative stimulatory receptor and allele of the inhibitory KIR3DL1, is studied. Bw4 MHC Class I proteins were implicated in this KIR's ligand specificity, but the authors were unable to generate binding of Bw4Ile80 tetramers in complex with epitopes to KIR3DS1 transiently expressed on 293-T cells, using a panel of HIV-epitopes differing at p7 and p8.
- This epitope, KYKLKHIVW (MHC Class I restriction, serotype Bw4) complexed with MHC A*2402 as a tetramer was unable to bind KIR3DS1 at 4, 20 and 37C. However, the A*2402-KYKLKHIVW complex does bind inhibitory KIR3DL1 subtype KIR3DL1*005.

Keywords supervised treatment interruptions (STI), acute/early infection
References Montefiori *et al.* 2003

- HIV-1 + patient AC10 underwent early HAART treatment, which was discontinued 1.5 years later. At this timepoint potent NAb responses against autologous virus were detected. Treatment interruption initially induced weak CD8+ responses directed against 5 epitopes. By days 873d and 923d the CTL response had broadened to target 22 epitopes; of these six were fully characterized. Eventually the virus escaped the NAb response, but escape was not accompanied by a rise in viral load, and the authors suggest the virus was contained by the CTL response.

Keywords responses in children, mother-to-infant transmission, escape, acute/early infection, viral fitness and reversion
References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness.
- Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- qYKLKHIVW is an escape variant of the A*24 epitope KYKLKHIVW, found in 9/10 clones from the mother. It was transmitted to her infant, and persisted for 15 months. Both the mother and child are A*24+.
- qYKLKHIVW elicted lower responder cell frequencies than KYKLKHIVW.

Keywords rate of progression, immunodominance
References Geldmacher *et al.* 2007b

- The objectives of this study were to find antiviral epitopic determinants of Gag HIV-specific CTL response and to find 'host HLA-CTL response' correlations. By studying 56 ART-naive subjects including low viral load (LVL) responders, the authors show that subjects expressing the "protective" HLA-B*0702, -B*5801, and -B*8101 have broader Gag epitope recognition which may be abrogated if co-expressed with HLA-B alleles associated with rapid AIDS progression. Also, a negative linear relation was seen between Gag epitope numbers and plasma viral load while a positive relationship was seen with CD4 T-cell count. Finally, LVL subjects recognized specific Gag regions at the N- and C-termini of the protein more often than peptides in the middle of the protein.
- Epitope HYMLNHIVW is overrepresented for recognition within the LVL group. However, this immunodominant epitope is most variable of all.

CTL CD8+

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, KHIVWASRELERFAV, had an overall frequency of recognition of 16.7% - 23.7% AA, 19.2% C, 9.1% H, 4.8% WI.

References Masemola *et al.* 2004b

- Highly targeted regions in Gag for CD8+ T-cells were defined for individuals with C clade infections in South Africa. 9 specific epitopes within the most reactive regions were characterized. This is 1 of 5 novel epitopes that were found among subtype C HIV-1 from African patients who hadn't previously been identified in B clade infections. Some epitopes were shown to be promiscuous, presented by multiple class I restricting alleles.
- HLVWASREL was presented by Cw*08 and newly identified in this study; Cw*08 is slightly more common in Zulus than Caucasians (0.066 versus 0.038).

Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A11)
Country China
Assay type CD8 T-cell Elispot - IFNγ
References Gong *et al.* 2006

- CTL responses were studied in treated and untreated donors from China, using Gag peptides from Henan isolate. All peptides were predicted to have A2 or A11 restriction (two of the most prominent alleles in Chinese population) and HLA restriction was further analyzed by CTL recognition in patients carrying corresponding allele. Among treated donors, HLA-A2 donors had higher CTL response than than HLA-A11 donors. Chronically infected untreated individuals had higher magnitude of CTL response than treated ones.

Assay type CD8 T-cell Elispot - IFNγ
Keywords characterizing CD8+ T cells
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords binding affinity, immunodominance
References Frahm *et al.* 2004
- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol.

76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This overlapping peptide, ASRELERFAVNPGLL, was differentially targeted across ethnic groups and had an overall frequency of recognition of 13.3% - 6.8% AA, 26.9% C, 20.5% H, 0% WI (P value = 0.0068). HLA-A11 was the most commonly present HLA allele among individuals with responses to this peptide.

- This is the first documentation of transmission of HIV-1 from a patient who developed AIDS (Progressor) to an Elite Suppresssor (ES).
- Both patients are HLA-B*5703-positive. The ES also has B*27 allele. Escape mutations in HLA-B*57-restricted epitopes were present in both patients, suggesting that they by themselves cannot explain the difference in the outcomes.
- The study concluded that viral replication is controlled in ES by at least two mechanisms: (i) direct inhibition of viral replication by polyfunctional HIV-1 specific CD8+ T cells that proliferate in response to autologous viral peptides; (ii) selection for and maintenance of escape mutations that have a negative impact on viral fitness.
- This epitope elicited IFN-γ response in the ES.

CTL CD8+

- To correlate evolving HIV-1 populations with HLA-A2 restricted immune responses for epitopes in Gag, Pol, Env and Nef, 11 treatment-naive subjects were longitudinally studied. Results show that increased viral load is often associated with broad CTL responses early in infection that persist as an "immunological footprint". Conversely, early, restricted responses may help limit viral load. Phylogenetic and functional evidence of viral escape is seen in Gag, Nef and Pol. Gag and Nef show flanking epitope changes restricted by non-HLA-A2 alleles. As far as modes of viral adaptation, CTL responses were seen to develop both against static viral populations resulting in viral evolution to HLA-A2 as well as against existing mutants resulting in reselection of consensus B-like variants. This study reinforces that CTL immune responses detected are not necessarily beneficial to patients, but may be "footprints" from early effective responses that the virus has since escaped.
- In one patient, this epitope GSEELRSLY varied at Y79F to GSEELRSLf, at an anchor position, conferring potent viral escape. One other variant seen was GSEELRSLc.

Keywords escape, acute/early infection, characterizing CD8+ T cells
References Milicic *et al.* 2005

- CTL responses and escape were analyzed in 4 homosexual couples where blood samples were available within weeks of estimated transmission. When the recipient had the same HLA type as the donor, CTL escape variants prevented a CTL response to those epitopes in the recipient. Even when the HLA alleles were different in the transmitting couple, a single escape mutation in one epitope can abolish CTL recognition of an overlapping epitope of distinct restriction in the recipient. In an early acute infection of the donor, the precise timing of transmission determines the viral variants transmitted.
- Escape mutation gteelrslF in this epitope resulted in 98% reduction in HLA binding affinity, and was the transmitted variant.

Author Location p17 (71–79 HXB2)
Epitope `GSEELRSLY`
Epitope name GSE
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A1)
Keywords HAART, ART, supervised treatment interruptions (STI), immunodominance, acute/early infection
References Oxenius *et al.* 2000

- Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable.
- This epitope was not recognized by the 6/8 study subjects that were HLA-A1.

Epitope `GSEELRSLY`

Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (A1)
Keywords HIV exposed persistently seronegative (HEPS)
References Kaul *et al.* 2001a

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-A1 women, 1/1 HEPS and 3/3 HIV-1 infected women recognized this epitope, and the response was the dominant HLA-A1 response in all cases.

References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype D Gag. The autologous epitope sequence had dramatic changes, the epitope GSEELRSLY peptide was GtegikSLh, and so likely not the actual reactive epitope in the larger peptide.

Epitope GSEELRSLY
Immunogen HIV-1 infection
Species (MHC) human (B*57)
Country Kenya
References Peters *et al.* 2008a

- Gag sequences from 468 HIV-1 positive sex workers from the Kenyan Pumwani cohort were analyzed to bioinformatically identify positively selected residues that could be related to antigen processing. Mutation effects on disease progression were followed by mean CD4 counts. This method is also one way of identifying potential CTL epitopes and classifying them.
- A Gag positive selection map was generated and sites were classified as beneficial or harmful to HIV. They were correlated to antigen processing (proteasomal cleavage), antigen presentation (TAP transport efficiency) and T-cell receptor binding.
- p17 and p24's structural constraints limited their diversity, while p7-p1-p6 showed a higher average entropy.
- GSEELRSLY is a previously identified HLA-A*0101 restricted epitope.

Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 were chronically infected and treated; 22 started treatment during acute infection; 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.

References Chitnis *et al.* 2003

- 17 perinatally HIV-1 infected children (0.08-16 years) were evaluated for HLA-A2-restricted IFN-gamma CD8+ CTL responses against 4 immunodominant peptides that carry HLA-A2 epitopes. Two peptides were from gp120 (one at position 112, one from the V3 loop), and one each was from gp41 and Gag. 15/17 patients responded to the Gag peptide, 13/17 to the gp41 and the non-V3 gp120 peptides, and 11/17 responded to the V3 loop. 4 children recognized all 4 peptides.
- In 10/14 children, addition of exogenous IL-15 induced increased frequencies of SFCs to the Gag peptide. IL-2 and IL-7 did not increase SFCs, however IL-2, IL-7 and IL 15 could all increase the intensity of the spots in some patients. In 4 children, IL-15 addition brought the SFC response up to the level of detection.

Assay type proliferation, CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Dyer *et al.* 2008

- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.
- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- Peptide 19 (NIH ARRP Cat# 7890), EELRSLYNTVATLYC, which contains an epitope restricted by HLA-A2 in different patients elicited the following CTL responses: (1) <1000 sfc/million PBMC in a living non-progressor for 22+ years; (2) in a living non-progressor at <50 sfc/million PBMC from 19 to 22+ years; (3) upto 22+ years at <1000 sfc/million PBMC for yet another living non-progressor; (4) <100 sfc/million PBMC upto 12 years in a low-viremic former non-progressor who succumbed to non-AIDS death; and (5) >100 sfc/million PBMC upto 22+ years in a deceased former non-progressor who lost viremic control.

References Karlsson *et al.* 2007

- To correlate evolving HIV-1 populations with HLA-A2 restricted immune responses for epitopes in Gag, Pol, Env and Nef, 11 treatment-naive subjects were longitudinally studied. Results show that increased viral load is often associated with broad CTL responses early in infection that persist as an "immunological footprint". Conversely, early, restricted responses may help limit viral load. Phylogenetic and functional evidence of viral escape is seen in Gag, Nef and Pol. Gag and Nef show flanking epitope changes restricted by non-HLA-A2 alleles. As far as modes of viral adaptation, CTL responses were seen to develop both against static viral populations resulting in viral evolution to HLA-A2 as well as against existing mutants resulting in reselection of consensus B-like variants. This study reinforces that CTL immune responses detected are not necessarily beneficial to patients, but may be "footprints" from early effective responses that the virus has since escaped.
- No CTL responses were detected against the EV9 epitope, ELRSLYNTV. A V82I variant, ELRSLYNTi was found.

Keywords HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-B*08-associated substitution within optimally defined epitope ELRSLYNTV is at positions T8, ELRSLYNtV. EV9 has very low recognition frequencies and no escape.

Subtype B, CRF01_AE
Immunogen HIV-1 infection
Species (MHC) human (B8)

Donor MHC A3, A32, B62, B8, Cw3
Country Netherlands
Assay type Other
Keywords subtype comparisons, computational epitope prediction, superinfection
References Kozaczynska *et al.* 2007

- The influence of superinfection upon changes in HIV-1 strains was studied in a triple infected subject. While continuous expression of all three strains was observed, the LTR promoters of subtype AE had highest activity of all 3 strains, and subtype B2 had the lowest. Env-V3 sequences were present in higher numbers in strains B2 and CRF01_AE. Recombination was seen between viruses B1/B2 in gag and vpr genes.
- This HLA-B08 restricted epitope, ELkSLYNTV, varied to ELRSLYNTV in 50% of viruses in B1 within 4 years, ELkSLfNTV in 67% of viruses in strain B2 within 3 years, and ELkSLYNTV in AE at the earliest time point taken, with no changes over time. A reversion was seen in B2 to ELkSLYNTV i.e. f to Y, suggesting a lack of CTL pressure on this sequence.

Keywords HAART, ART
References Sabbaj *et al.* 2003

- This study monitored epitope responses in HIV-1 infected minority women living in the United States.
- 24 epitopes were described – 8 were novel, 8 used new restricting elements but were previously defined epitopes, and 8 were previously described.
- Serial peptide truncations were used to define optimal epitopes for CTL cell lines isolated from 12 individuals, assayed by a Cr-release.
- Subject 00RCH33 was on HAART had a viral load of 2900 and CD4 count of 727 and also recognized the epitopes YPLTFGWCY, Nef(135-143), HLA B*5301; AETFYVDGA, RT(437-445), HLA B*4501; and HIGPGRAFY, gp160(310-318), HLA A*3002.
- Among HIV+ individuals who carried HLA B30, 3/16 (19%) recognized this epitope.

Immunogen HIV-1 infection
Species (MHC) human (A*3002)
Country South Africa
Assay type CD8 T-cell Elispot - IFNγ
Keywords characterizing CD8+ T cells
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Immunogen HIV-1 infection
Species (MHC) human (A*3002)
Country South Africa
Assay type CD8 T-cell Elispot - IFNγ
References Chopera *et al.* 2008

- Transmission of HIV-1-escape variants from individuals with protective HLA-B*57/-B*5801 alleles to those without these alleles was studied to determine if infection with such replication-deficient mutants offered any advantage to the new host. Dependency between slower rate of disease progression in the newly infected subject and protective genotype of the infecting individual was suggested.
- HLA-A*3002-restricted epitope RSLYNTVATLY, within peptide TGTEELRSLYNTVATL was able to elicit CTL response in a T242N/A146X viral-mutation-carrying subject. T242N/A146X are common HLA-B*57/-B*5801 associated escape mutations.

Epitope `RSLYNTVATLY`
Immunogen HIV-1 infection
Species (MHC) human (A*3002)
Country Kenya
References Peters *et al.* 2008a

- Gag sequences from 468 HIV-1 positive sex workers from the Kenyan Pumwani cohort were analyzed to bioinformatically identify positively selected residues that could be related to antigen processing. Mutation effects on disease progression were followed by mean CD4 counts. This method is also one way of identifying potential CTL epitopes and classifying them.
- A Gag positive selection map was generated and sites were classified as beneficial or harmful to HIV. They were correlated to antigen processing (proteasomal cleavage), antigen presentation (TAP transport efficiency) and T-cell receptor binding.
- p17 and p24's structural constraints limited their diversity, while p7-p1-p6 showed a higher average entropy.
- RSLYNTVATLY is a previously identified HLA-A*3002 restricted epitope.

Keywords HAART, ART, supervised treatment interruptions (STI)
References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (`http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html`) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8+ T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient D displayed the greatest response to B27-KK10 (p24), and also responded to A30-RY11(p17), A32-PW10(RT), A30-KY11(RT), A32-RW10(gp120), and B18-YY9(Nef).

Assay type CD8 T-cell Elispot - IFNγ
Keywords binding affinity, subtype comparisons, acute/early infection
References Malhotra *et al.* 2007b

- T-cell responses to clade B Gag peptides were tested using sequences based on consensus (CON), most recent common ancestor (ANC) and center of tree (COT); as well as CON sequences from clade A, clade C and M-group Gag. It was found that Gag-specific cross-clade T-cell IFN-gamma responses are detectable during primary infection, and there was no significant difference in breadth or magnitude of responses with the different peptide sets. While several epitopes in low diversity domains are invariant across clades, other recognized variants are seen outside HLA anchor positions. T-cell immunity often tolerates conservative or semi-conservative amino acid substitutions but changes presumed to be in TCR contact sites may abrogate epitope recognition.
- This epitope, RSLYNTVATLY, is invariant across CON A, B, C and M-Group sequences, as well as clade B COT and ANC sequences. HLA-A30 restriction was inferred based on subject possessing appropriate HLA class I allele and prior publication.

Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, cross-presentation by different HLA, optimal epitope
References Frahm *et al.* 2005

- HLA-B63-positive subjects were shown to be able to generate CTL responses early in acute HIV infection and to control HIV replication in the absence of antiretroviral treatment. Since HLA-B63 shares the epitope binding motif of HLA-B57 and -B58, it was shown that HLA-B63-positive individuals mounted CTL responses to previously identified B57-restricted epitopes, as well as novel, B63-restricted epitopes. Moreover, these novel B63-restricted epitopes can also be presented by HLA-B57 and -B58.
- This is a putative HLA-B63/57/58 epitope containing the B58 supertype binding motif. Peptide reactivity was enriched for those that carry B63, with a trend for those that carry B57/B58. Optimal epitope was defined in an individual that was B*1517(B63)/B58 positive.

Keywords vaccine-induced epitopes, immunodominance, vaccine antigen design, SIV
References Liu *et al.* 2006a

- An SIV Gag DNA vaccine was studied in mice in order to enhance subdominant immune responses to the KV9 epitope, without compromising its immunodominant response to the Gag AL11 epitope. Both epitopes share a common MHC restricting allele. Novel vaccine strategies including anatomic separation and heterologous prime-boost were investigated to expand vaccine-elicited CTL responses. This was the first study of its kind using DNA gene-based vaccines.
- This epitope, KSLYNTVCV (KV9), was the subdominant epitope studied, but it was capable of eliciting a response of comparable magnitude to the immunodominant epitope, AL11, in the absence of AL11 during vaccine priming.
- This subdominant epitope KV9 had an augmented response even in the presence of immunodominant AL11, making their responses codominant, when vaccine administration used anatomic separation or heterologous boost strategies.

Keywords rate of progression, escape, immune evasion
References Karlsson *et al.* 2007

- To correlate evolving HIV-1 populations with HLA-A2 restricted immune responses for epitopes in Gag, Pol, Env and Nef, 11 treatment-naive subjects were longitudinally studied. Results show that increased viral load is often associated with broad CTL responses early in infection that persist as an "immunological footprint". Conversely, early, restricted responses may help limit viral load. Phylogenetic and functional evidence of viral escape is seen in Gag, Nef and Pol. Gag and Nef show flanking epitope changes restricted by non-HLA-A2 alleles. As far as modes of viral adaptation, CTL responses were seen to develop both against static viral populations resulting in viral evolution to HLA-A2 as well as against existing mutants resulting in reselection of consensus B-like variants. This study reinforces that CTL immune responses detected are not necessarily beneficial to patients, but may be "footprints" from early effective responses that the virus has since escaped.
- The major p17 Gag SL9 epitope, SLYNTVATL, varied to SLYNTiATL with change V82I at position 6 and SLfNTiATL with an additional change Y79F at position 3. The 79F mutant elicited lower magnitude and functional avidity responses than 82I and 79F82I mutants. Even so, in time most variants were Y79F which showed positive selection. This Y79F mutant was seen combined with upstream changes E62G/V/A. In combination with 62E and 62G however, the Y79F mutant did not propagate successfully. Later, in combination with 62A the 79F mutant coincided with increasing viral load.

References Blankson *et al.* 2006

- Based on two papers, Iversen 2006 and Frahm 2006, the authors point out that in choosing epitopes for use in AIDS vaccines not only immunogenicity but fitness cost of escape mutations must be considered. Thus immunization may be made to both wild-type and common escape variants.
- Frahm et al. showed subdominant epitopes of an HLA-B*1503 restricted response to HIV were able to reduce viremia. Thus, while epitopes that lack sequence variation may form good targets, so would subdominant epitopes.
- Iversen et al. found 2 pathways of conservative residue change that affect CTL epitope contacts with HLA-A*02: one acquiring escape mutations (SLfNTiAvL) and the other retaining or reverting to index residues in Gag protein's SLYNTVATL (SL9) epitope.
- Since viral loads in patients with escape mutations in SL9 are typically lower, it is suggested that CTL responses to subdominant epitopes in such patients may be involved in replication control.

- Cross-clade CTL epitope recognition was tested for functional responses by CTL suppression using endogenously derived cell-surface epitopes rather than supraphysiologic exogenously added peptide epitopes. Functional avidity was actually diminished in non-autologous clade epitopes, calling into question current methods for assessing cross-clade or standard CTL activity and therefore vaccine design.
- SL9 epitope variants used were SLYNTVATL for clades B/A1/C/D, SLYNTVAVL for clades A2/F1, and SLFNTVATL for clades G/K. Clade B-elicited CTLs recognized epitopes from all other clades when tested by Cr-release. Suppression of HIV replication however, as well as functional avidity were reduced for different clade consensus epitope sequences.

- TCR can recognize multiple and distinct ligands. A model of TCR peptide recognition using amino acid similarity matrices is developed here, to predict cross-reactivity within diverse CTL epitopes. The ability of TCRs to recognize unrelated peptides with high specificity is termed "poly-specificity" here.
- Non-immunogenic HIV peptides were found to be similar to human self-antigens, suggesting that sequence similarity to self-antigens is what discriminates between immunodominant and cryptic epitope-elicited CTL responses.
- TCR specificity is position dependent in SLFNTVATL, similar aa substitutions usually do not affect TCR recognition of epitopes. In this epitope, position 1 is consistently of less importance and can tolerate mutation. Position 5, however, can only tolerate one possible mutation, T5S, to SLFNsVATL. Postions 2-6, and 8-9 are most important for peptide recognition and positions 2 and 9 determine peptide binding.

Keywords HLA associated polymorphism
References Brumme *et al.* 2008b

- A large chronically infected, treatment naïve cohort was studied to identify and organize HLA I-associated polymorphisms in Gag into an immune escape map. Insertion polymorphisms at p17 C-terminus were associated with HLA-B*44, -A*32, -C*05. Inverse correlations were found between number to HLA-associated sites and pVL as well as escaped Gag residues and pVL. pVL positively correlates with CD4 T-cell count. No enrichment for HLA-associated polymorphisms are seen at anchor residues, showing that CTL escape is primarily not through abrogation of peptide-HLA binding.
- No HLA-A*02 associated substitutions were seen in p17 SLYNTVATL.

Keywords epitope processing, escape
References Peters *et al.* 2008a

- Gag sequences from 468 HIV-1 positive sex workers from the Kenyan Pumwani cohort were analyzed to bioinformatically identify positively selected residues that could be related to antigen processing. Mutation effects on disease progression were followed by mean CD4 counts. This method is also one way of identifying potential CTL epitopes and classifying them.
- A Gag positive selection map was generated and sites were classified as beneficial or harmful to HIV. They were correlated to antigen processing (proteasomal cleavage), antigen presentation (TAP transport efficiency) and T-cell receptor binding.
- p17 and p24's structural constraints limited their diversity, while p7-p1-p6 showed a higher average entropy.
- HLA-A*0201-restricted SL9, SLFNTVATL, has positively selected F79Y i.e. SLyNTVATL and T81A i.e. SLFNaVATL. SLyNTVATL has significant positive correlations with HLA-A*0202 and negative correlations with HLAs-A*0101, A*3002 and A*3601. The negative correlations suggest that Phe(F) is an escape mutation within SL9 that became fixed in the population. Mutation T81A is negatively correlated with HLA-A*0201. Other positive selections are mutations flanking SL9, viz. L75I and I92M correlating to HLA-A*02 and

are possible peptide processing and recognition mutants. Another HLA-A*0201-restricted SL9 mutation, V82I, SLFNTiATL, correlates with a decrease in CD4 counts.

CTL CD8+

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T-cells and viral load was also found.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWIILGGLNK.
- The subject with A*0201 had a moderately strong response to SLYNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

Immunogen HIV-1 infection
Species (MHC) human (A*0201)
Keywords HAART, ART
References Mollet *et al.* 2000

- A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using tetramer staining or CD8+ cell IFNgamma production to measure responses.
- In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished.
- Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.

Epitope SLYNTVATL
Immunogen HIV-1 infection
Species (MHC) human (A*0201)
Keywords supertype, rate of progression
References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- Tetramer staining with A2, beta2microglobulin, and either SLYNTVATL, KLVGKLNWA, or LTFGWCFKL revealed that tetramers detected more HIV-specific sells in LTNP than in progressors, activated effector cells were the minority population, and ELISPOT correlated better with the effector cell subpopulation than the total tetramer stained population.

Species (MHC) mouse (A*0201)
Keywords binding affinity, vaccine-specific epitope characteristics, immunodominance
References Peter *et al.* 2001

- The stability of peptide binding to HLA-A2.1 was determined for six HLA-A2.1 peptides included in this vaccine study – ILKEPVHGV (RT), SLYNTVATL (p17), SLLNATDIAV (gp41) and LLWKGEGAV (RT) all bound with high affinity comparable to a influenza epitope reference (GILGFVFTL), while RGPGRAFVTI and VIYQYMDDL bound with a lower affinity (relative binding activity = 0.01).
- The four high-affinity peptides formed stable complexes with half-lives ranging between 8 and 32 hours, while the low affinity peptides had half lives of less than an hour.
- HLA-A2.1 transgenic mice were immunized with the six HIV-1 peptides and P30, as a universal T-helper epitope, with IFA or Montanide or microspheres as adjuvants.
- All peptides except VIYQYMDDL induced a stong CTL response in Cr-release assays - stronger responses were observed when peptides were delivered alone, indicating immunodominance when the combination was used.

Species (MHC) mouse (A*0201)
Keywords vaccine-specific epitope characteristics, immunodominance
References Peter *et al.* 2002

- When HIV-1 peptides were used to vaccinate HLA-A2.1 transgenic A2-Kb mice, strong responses to five peptides were observed when the peptides were given individually, but immunodominance limited the response to some of the peptides when they were given in combination Peter *et al.* [2001]. IL-12 can counteract immunodominance in BALB/c mice, so it was given with the multiple epitope vaccination, and was instead found to specifically eliminate the HLA-A2.1-epitope CTL responses, but not Kb CTL responses. This was possibly a consequence of transient depletion of T-cells, B cells and macropahges in the spleen.

Epitope SLYNTVATL
Immunogen computer prediction
Species (MHC) (A*0201)
Keywords subtype comparisons, computational epitope prediction, vaccine-specific epitope characteristics, escape
References Schönbach *et al.* 2002

- Computational methods (artificial neural networks [ANN], hidden Markov models [HMM], binding matrices based on HLA association rates BIMAS) were used to identify HLA-A*0201 and HLA-B*3501 HIV T-cell epitope candidates from 533 Gag, Env and Pol sequences of which 374 were derived from HIV-1, 97 were derived from HIV-2 and 62 from SIV. Comparisons to known epitopes and between clades were made.
- The SLYNTVATL epitope received focused discussion. SLYNTVATL, slFntvatl, slyntvaVl, and syntIaVl are all recognized variants, ANN predicts all four variants would be recognized, while BIMAS only predicts SLYNTVATL and slFntvatl would be recognized. However, Sewell *et al.* [1997] suggested certain substitutions may be antagonistic, including slFntvatl, and vaccines do not stimulate SLYNTVATL responses as well as natural infections. The authors note these kinds of issues complicate the application of computational predictions of epitopes to vaccine design.

References Imami *et al.* 2002b

- 70 patients with chronic disease progression, 10 clinical non-progressors, and 3 immunologically discordant progressors (individuals who controlled viremia but had progressive CD4+ T-cell decline) were analyzed for their T-helper cell responses to p24 and cytokine profile. Long term non-progressors had much stronger Th responses, particularly to p24 peptides, and they tended to be balanced between Th1, IL-2 producing and Th2, IL-4 producing responses.
- One of the immunologically discordant progressors became symptomatic during the course of the study, and he had a rapid drop in proliferative response to all antigens and also a shift from a Th1 to a Th2 response. To find out if the CD8 response also shifted in cytokine production, the CD8+ T-cell response to SLYNTVATL in this patient was also tested. It too was found to shift, from IFNgamma to IL-4 producing in Elispot, and using a bioassay of indicator lines, from IL-2 to IL-4 production.

References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- Only 1/10 HLA A*02 carrying individuals in this study recognized SLYNTVATL.
- All HIV-1 proteins except Vpu were recognized, and responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

- Telomer length is short in the CD8+ T-cell compartment of HIV-1 infected people, indicating excessive CTL activation and premature senescense. Here human telomerase RT (hTERT) transduction of HIV-1-specific CTL was used to study the functional impact of telomerase. Telomerase expression enhanced proliferative capacity, as well as cytolytic and antiviral capabilities; cytokine production was unchanged. hTERT transduced CTLs were 10-fold more efficient in controlling HIV-1 replication in culture. Thus telomerase transduction can restore CTL mediated cytolysis, and may have therapeutic potential.
- Three polyclonal CD8+ T-cell lines derived from an HIV-1, HLA A*0201 positive patient were used in this study, including one specific for this epitope.

- Epitope escape mutations in chronically infected individuals developed over several years indicating selective advantage of escape mutants. The maturation state of CTLs appear to affect the rate of epitope mutation and CTL decay.
- In two patients, SL9-specific CTL peaked at 2-4 years post-infection; at that point the escape mutations began to dominate followed by CTL decline with a 6 month lag, suggesting CTL decline resulted as a consequence of escape. In a third patient, the initial response was 1/2 as strong and mutations did not arise until 6-7 years post-infection; in that case the decline in SL9 CTL preceded epitope mutation.
- Two patients HLA-A*0201 started out with a non-consensus sequence, slFntvatl. In one of the patients, a transient reversion to the consensus was observed after 4 years, that did not reappear until the 11th year, suggesting the possibility that a reversion to the consensus form occurred, but a CTL response may have limited it so that this more fit form could not reassert itself until the patient had a more severely compromised immune response.

- SL9-specific CTLs were shown to be primed by immature DCs and independent of help from CD4+ or exogenous IL2, and sensitive to paracrine IL-2 induced apoptosis. The authors suggest that the reason SL9 responses are not seen during acute infection is the high level of innate immune responses resulting in cytokine-induced apoptosis, but that these CD8+ T-cells would come to dominate later infection when CD4 help is diminished.

- A novel technique for subtractive analysis of HIV-1 specific CTLs was developed, including depletion of peptide-specific CTLs by stimulating PBMCs with the specific peptide in the presence of 5-FU, followed by TCR spectratyping for clonal breadth analysis. In analysis of infected individuals using this technique, it was found that HIV-1 specific responses range from two to 10 different T-cell clones per epitope.
- The SL9 responses in one individual were complex, with TCR in multiple families, including: Vbeta12.2, Vbeta17, Vbeta23.3 and Vbeta22.
- This paper provides further evidence for the polyclonal nature of epitope-specific responses. Polyclonal responses may be able to better inhibit escape and may play a beneficial role in progression.

Immunogen vaccine
Vector/Type: measles virus (MV) *Strain:* multiple epitope immunogen *HIV component:* gp140, gp140ΔV3
Species (MHC) transgenic mouse (A*0201)
Assay type Chromium-release assay, Flow cytometric T-cell cytokine assay
Keywords memory cells, vaccine antigen design, antibody generation, characterizing CD8+ T cells
References Lorin *et al.* 2005a

- A recombinant measles MVSchw virus expressing an HIV-1-derived polyepitope effectively primed HLA-A*0201-restricted CTL responses against multiple conserved HIV-1 epitopes in HLA-A*0201 transgenic mice. Also, a recombinant MVSchw virus expressing gp140 with deleted V1, V2, and V3 loops successfully induces neutralizing antibodies against HIV-1. A live attenuated measles vaccine could provide a safe and efficient pediatric vaccination vector for simultaneous vaccination against HIV and measles.

Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding
Keywords HAART, ART, responses in children, dendritic cells
References Zhang *et al.* 2006b

- Immune responses in HIV-1 infected children either undregoing HAART or not were analysed. HIV-specific CTLs were lower in children responding to HAART than in non-responders and HAART-naive children. CTL frequency was correlated with myeloid DC frequency in treatment-naive patients, and inversely correlated with duration of virus supression following treatment.
- 11 of the 22 children had significant responses to SL9.

Epitope SLYNTVATL
Immunogen HIV-1 infection
Species (MHC) human (A*0201)
Assay type CD8 T-cell Elispot - IFNγ, HLA binding
Keywords HAART, ART, escape, viral fitness and reversion
References Asquith *et al.* 2006

- In order to reconcile apparent conflicts between a CTL-protective role as suggested by HLA-1 alleles associated with different rates of progression to AIDS, and a CTL non-protective role as suggested by the fact that virus clearance following ART is not impaired in advanced AIDS, a model is made that quantifies the efficiency of HIV-1-specific CTLs in vivo. As a surrogate for the actual rate of CTL-killing of infected cells, the model rests on calculating virus escape rate for an epitope and subtracting its reversion rate upon transmission to a non-restricting HLA bearing host. It is shown that CTLs recognizing a single epitope kill only 2% of productively infected CD4+ cells. The rate of CTL lysis was found to be significantly faster during primary infection than in chronic infection. However, the authors suggest that small differences in CTL lysis rate can translate into large differences in terms of absolute numbers of infected cells killed, which are likely to be clinically relevant.
- The best estimate of escape rate for this epitope, SLYNTVATL, was found to be 0.006/day (upper bound on rate of escape = 0.008), with SE of 0.001.
- Four variants were shown to confer escape (Y79F, Y79F-V82I, Y79F-T84V, V82I-T84V), and variant A83V was also present but untested for CTL response.

Species (MHC) human (A*0201)
Assay type Cytokine production, Flow cytometric T-cell cytokine assay
Keywords binding affinity, co-receptor, characterizing CD8+ T cells
References Laugel *et al.* 2007a

- It was found that CD8 co-receptor differentially fine tunes CTL function via cytokine/chemokine production (MCP-1, MIP1-beta, MIP1-alpha, TNF-alpha, RANTES, IFN-gamma, IL-2 and IL-4). Differential CD8 action was controlled by abrogating its engagement using point-mutated HLA Class I molecules in 4 CTL clones specific for 3 different epitopes from HIV-1 and hTERT.
- 2 HLA-A*0201 restricted CTL clones, SLY-10 and 003, specific for HIV-1 Gag eptiope SLYNTVATL were stimulated with cognate antigen and found to have different diversities as well as hierarchies of cyto/chemokine production. Epitope variants 3H (SLHNTVATL), 3S (SLSNTVATL) and 3F (SLFNTVATL) also selectively blocked effector functions for

each clone. CD8 co-receptor requirement was minimally affected for the index ligand SLYNTVATL recognition by CTL, but weaker agonists viz. the epitope variants depended more on co-receptor binding. However, MIP1-beta and IL-2 were consistently the least- and most-CD8 dependent effector secretions.
- This is the first documentation of secretion of MCP-1 by T cells. It seems to require high antigen and co-receptor dependency for release.

References Iversen *et al.* 2006

- The evolution of SLYNTVATL epitope was analyzed over 10 to 20 years in 76 patients and it was found that two opposing selective forces act on the epitope in HLA-A2+ patients. One is caused by an effective CTL pressure, resulting in escape. The main escape mutations were in positions 3, 6 and 8 of the epitope. The other force is selection for optimal viral growth, where the wild-type epitope's index amino acids are selected for. These common evolutionary pathways for the epitope were conserved across several HIV subtypes; while the balance between the opposing evolutionary pathways is suggested to determine variants in a patient at any given time. Fitness cost to SL9 variant generation leading to CTL escape also contributes to lower viral loads in such patients.
- Most variation in this epitope affects TCR recognition as shown by binding studies. Heterogenous CTL responses in patients to viral epitope variants also suggest that the advantage of any single mutation in SL9 is host (and HLA) dependent.
- CTL selection can differ between compartments as seen in compartmentalization of epitope variants between blood and cervix samples.

References Bennett *et al.* 2007

- Standard assays like ELISpot, ICS and tetramer staining do not measure antiviral activity of HIV-infected CTLs, but use exogenous synthetic peptides on uninfected cells, or HLA tetramers. Similarly, functional avidity assesses CTL activity against uninfected target cells. Here functional avidity is compared to the efficiency of actual infected cells' recognition and killing, revealing a sharp threshold between CTL immune antiviral activity and lack of infected cell recognition.
- As previously shown, epitopes and their variants spanned orders of magnitude of SD50. Likewise, CTL clearance of infected cells varied from 0 to 100% with epitope sequence variation. Moreover, direct suppression of HIV-1 replication by CTLs also varied with epitope variant.
- When killing efficiency (KE) using virus-infected cells was compared to functional avidity using synthetic peptides, there was a narrow threshold separating maximal killing from almost none. Since different SL9-specific clones had similar KEs, which were vastly different from RL10-specific CTL KEs, it was obvious that KEs varied with epitope sequence too. Finally, a strong correlation between KE and inhibition of viral replication was also seen.
- This epitope, SLYNTVATL, showed marked differences in its functional avidity, killing efficiency, as well as inhibition of viral replication when compared to its variants SLfNTVATL, SLfNTiATL, SLYNTiAvL, SLYNTiATL, SLYNaVATL and SLYNlVAvL.

CTL CD8+

- The dependence of TCR clonotype recruitment on genetic background was determined by studying monozygotic twins infected with the same HIV-1 strain. After an early, initial correlation in the magnitude, specificity and immunodominance of CTL response [Draenert et al. J. Exp. Med. 203:529-539(2006)], subsequent disease was mixed with respect to CTL epitopes' mutational escape. TCR alpha and beta chain repertoires were analyzed and it was found that their clonotypes in HIV-specific CTLs were broadly heterogeneous for both concordant and discordant epitope sequence evolution between the twins. Therefore initial TCR recruitment appears to be an entirely random process independent of genetic background of the infected individual.
- This epitope, SL9, showed discordant epitope evolution between the twins, and both alpha and beta TCR chains recruited were entirely different between them.

- To identify immunogenically optimized peptide epitopes for use in vaccines, two strategies were used. The first studied rare mutant epitopes that were effective in generating a cross-reactive immune response against a range of mutants. The second method was to use a synthetic combinatorial library of peptides and screen for highly effective responses against one epitope (TV9, TLNAWVKVV) and its mutants. Candidate epitopes were tested in HLA-A2 transgenic mice as well as ex vivo human lymphocytes.
- Mutants of epitope SL9 when tested in transgenic mice, showed that the consensus and most common mutant, SLfNTVATL, were weakly immunogenic or cross-reactive. 3 mutants, SLYNlVATL, SLfNlVATL and SiYNlVATL were highly immunogenic. Peptide SiYNlVATL with the additional L2I change allowed great cross-reactivity to the consensus. Other mutants were SLfNTVATL, SLfNTVAvL, SLYNTVvvL, SLfNlVAvL, SvYNTVATL, SLYNTVAaL, SLYNTiAaL, SLfNTVATp and SLfNTiATi.

Epitope SLYNTVATL
Epitope name SL9
Immunogen HIV-1 infection
Species (MHC) human (A2)
Keywords dendritic cells
References Kundu *et al.* 1998b

CTL CD8+

- Allogeneic dendritic cells (DCs) were obtained from HLA-identical siblings, pulsed with rgp160 MN or A2-restricted HIV-1 epitope peptides, and infused monthly into six HIV-infected patients.
- 1/6 showed increased env-specific CTL and increased lymphoproliferative responses, 2/6 showed increase only in proliferative responses, and 3/6 showed no change – pulsed DCs were well tolerated.
- SLYNTVATL is a conserved HLA-A2 epitope included in this study – 3/6 patients had this sequence as their HIV direct sequence, one had the form SLYNTVAVL and all four of these had a detectable CTL response – the other two had either the sequence SLFSAVAVL or SLFSAVAAL and no detectable CTL response.

Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (A2)
Keywords subtype comparisons, HIV exposed persistently seronegative (HEPS), immunodominance
References Kaul *et al.* 2001a

- Variants SL(F/Y)NTVATL are A/B clade specific.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-A2 women, 1/10 HEPS and 22/26 HIV-1 infected women recognized this epitope, likelihood ratio 18.3, p value < 0.003, and ILK(D/E)PVHGV tended to be more reactive in HEPS women, SL(F/Y)NTVATL in infected women.
- The dominant response to this HLA allele was to this epitope in the 1/10 HEPS case and in 18 of the 22/26 HIV-1 infected women that responded.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.
- Subject ML 1250 had an A2 response to ILK(D/E)PVHGV prior to seroconversion, which switched to SL(F/Y)NTVATL post-seroconversion.
- Subjects ML 1575 and ML 1592 had no response to SL(F/Y)NTVATL prior to seroconversion, but made responses post-seroconversion.
- Subject ML 1760 had an A2 response to ILK(D/E)PVHGV prior to seroconversion, and gained responses to epitopes A2 SL(F/Y)NTVATL and B27 KRWII(L/M)GLNK post-seroconversion.

Immunogen HIV-1 infection
Species (MHC) human (A2)
Keywords epitope processing
References Cohen *et al.* 2002

- The antigen presentation of two A2-restricted epitopes was compared, SLYNTVATL (p17) and ILKEPVHGV (RT). HIV-1 infected cells were more sensitive to lysis by SLYNTVATL-specific CTL than by ILKEPVHGV-specific CTL, because of a higher density of SLYNTVATL-A2 resulting from differences in processing.
- Incubation with a T1-cell proteolytic extract showed that by four hours, 25% of a p17 peptide had a C-term Leu-85 and were SLYNTVATL-precursors, while ILKEPVHGV-precursors were far less frequent (6.8%) even with four times more proteolytic extract after 30 hours.
- p17 was preferentially cleaved between Leu85 and Tyr86, while appropriate Val484 and Tyr485 cleavage was minor for RT.
- In a competition experiment, RSLYNTVATL bound TAP 3.7-fold more efficiently than RT peptides.
- No difference in CTL avidity was detected in six patients with HLA-A2-restricted responses to these epitopes.
- No significant difference in HLA-A2 binding to p17 or RT epitopes was observed.

Assay type Chromium-release assay, Flow cytometric T-cell cytokine assay
Keywords class I down-regulation by Nef
References Bobbitt *et al.* 2003

- Nef, through Nef-mediated MHC-1 down-regulation, is not the only viral protein to influence levels of HIV-specific CTL recognition. The Rev L60F mutation, a common natural variant, can decrease CTL recognition of late gene products. The Rev mutation impacts the early to late gene switch, reducing late gene product production (Gag, Pol, Env, Vpu, Vpr and Vif), while increasing Nef production, both of which reduce the impact CTL recognition of late gene products. As expected, Rev L60F rendered HIV infected cells more resistant to CTL that recognized epitopes from the late proteins Env and Gag. Gag expression is reduced more than Env, and Gag-specific CTL were more profoundly affected. Conversely CTL against an epitope in an early gene product, Tat, were more effeciently recognized when infected with viruses carrying the Rev L60F mutation.
- Patients in the asymptomic phase with active immune responses had more CTL resistant viruses, with lower Rev activity, lower Gag expression and greater resistance to Gag-specific CTL killing, while viruses isolated from people with AIDS were more sensitive to CTL killing.

Species (MHC) human, transgenic mouse (A2)
Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric T-cell cytokine assay
Keywords binding affinity, subtype comparisons, computational epitope prediction
References Corbet *et al.* 2003

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This epitope was one of the previously identified HLA-A2 epitopes studied.
- 10/17 HIV-infected HLA-A2+ people in this study recognized this epitope, and CTL and CD8+ T cells responses were elicted by immunization of transgenic mice with this peptide.

Assay type CD8 T-cell Elispot - IFNγ
Keywords supervised treatment interruptions (STI), early treatment
References Montefiori *et al.* 2003

- HIV-1 + patient AC10 underwent early HAART treatment, which was discontinued 1.5 years later. At this timepoint potent NAb responses against autologous virus were detected. Treatment interruption initially induced weak CD8+ responses directed against 5 epitopes. By days 873d and 923d the CTL response had broadened to target 22 epitopes; of these six were fully characterized. Eventually the virus escaped the NAb response, but escape was not accompanied by a rise in viral load, and the authors suggest the virus was contained by the CTL response.

Immunogen HIV-1 infection
Species (MHC) human (A2)
Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding, Flow cytometric T-cell cytokine assay
Keywords responses in children
References Sandberg *et al.* 2003

- 65 vertically HIV-1 infected children, ages 1-16, the majority undergoing ART, were analyzed in regard to their plasma viremia and CD4+ and CD8+ T-cell counts, and CD8+ T-cell responses.
- Using vaccina expressed Gag, Pol, Env, Rev, Nef in target cells in an Elispot assay, 85% of the children recognized at least one HIV antigen. Strong CD8+ T-cell responses were directed against Pol, followed by Gag and Nef. Children younger than 4 had significantly weaker responses (7/14 had no reponse) than older children (only 1/32 had no response, and responses were greater in magnitude).
- SLYNTVATL and ILKEPVHGV tetramers were used to quantitate specific responses. 49 chlidren in an expanded cohort carried HLA-A2. 1/11 children under 3 years of age had detectable CD8+ T-cell responses to SLYNTVATL, 2/11 to ILKEPVHGV. Among children over 3, 11/38 recognized SLYNTVATL and 9/38 recognized ILKEPVHGV.
- Older children that maintained a CD4 count greater than 400 cells/ul tended to have stronger CTL reponses.

Assay type Cytokine production, CD8 T-cell Elispot - IFNγ, Tetramer binding, Intracellular cytokine staining
Keywords assay standardization/improvement, memory cells
References Sun *et al.* 2003

- This study compares assay methods for testing CTL responses using samples from 20 HIV+ patients. The study compares ELISpot, tetramer-binding, and intracellular IFN-γ. Tetramer-bidning analysis was performed with Gag (SLYNTVATL) or Pol (ILKEPVHGV) tetramers. Antigen presentation using recombinant vaccinia viruses (rVVs) encoding HIV-LAI Gag, Pol, Env, Nef, Tat and Vif proteins was compared to peptide panels. HIV antigen recognition in memory CTLs was measured by chromium release assay and compared to effector/memory CD8+ T-cells in an IFN-γ ELISpot assay.
- Results: IFN-γ Elispot and flow cytometry gave similar frequencies of HIV specific CD8+ T-cells. Tetramer-binding analysis was most sensitive. Pools of peptides and the sum of frequencies of individual peptides were comparable. Elispot assays using peptides were more sensitive than assays using vaccinia expressed proteins. Cr release and Elispot against rVVs gave comparable memory cell responses 2/3s of the time.
- 3/7 HLA-A2+ patients recognized this epitope.

Author Location p17 (77–85 NL43)
Epitope `SLYNTVATL`
Epitope name SL9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A2)
Assay type Chromium-release assay, CTL suppression of replication
Keywords escape, TCR usage
References Yang *et al.* 2003a

- Virus was cultured in the presence of CTL lines specific for 5 different epitopes (SLYNTVATL, ILKEPVHGV, IEIKDTKEAL, SEGATPQDL, and KEKGGLEGL) to study the emergence of escape mutations. Escape varied between clones for the same epitope, and between different epitopes. Gag and RT epitope escape, if it occurred at all, tended to be monoclonal and within the epitope, indicating strong fitness constraints, while the Nef epitope escape was rapid, polyconal, and sometimes the result of upstream frameshifts.

- Three CTL clones were studied that recognized SLYNTVATL, 161JxA14, 18030D23, and 115DEC4. The different TCR usage on the CTL clones resulted in different patterns of recognition and escape. 161JxA14 suppressed the variant slFntvatl, 18030D23 did not; conversely the variants slfntIaVl and slFntIatl were suppressed by 18030D23, but not 161JxA14.
- After two weeks of passage the predominant escape mutant from 161JxA14 was slyntIatl. Amino acid residues flanking SL9 were unchanged. Escape mutations did not occur within two weeks for the two additional SL9-specific CTL clones 18030D23 and 115DEC4.

Epitope `SLYNTVATL`
Epitope name SL9
Immunogen HIV-1 infection
Species (MHC) human (A2)
Country United States
Assay type CD8 T-cell Elispot - IFNγ
Keywords variant cross-recognition or cross-neutralization
References Draenert *et al.* 2004c

- CD8+ T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2-39) epitopic regions were targeted in an average of 6 proteins (range, 1-8). HAART resulted in decrease in antigen and reduction in gamma IFN EliSpot responses, suggesting active responses to autologous virus. The lack of mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN-based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- 3 subjects recognized this epitope with high functional avidity. Relative to consensus, 2 individuals that had the SLYNTVATL epitope carried a R -> K mutation proximal to but outside the epitope; possible processing implications were not studied here.

CTL CD8+

- Killing efficiency of CTLs and their ability to suppress viral replication is shown to depend more on epitope specificity than to antigenic avidity. Different clones recognizing the same epitope had similar killing efficiency despite their variation in avidity. Nef specific CTL clones tended to be most inhibitory, followed by Gag, then by RT specific clones, regardless of avidity.
- 3/14 CTL T-cell clones tested were specific for Gag/p17-SL9. Under conditions of excess peptide (100ug/ml), there was no difference in their lytic potential; all possessed similar effector capacity. Avidity was measured as the sensitizing dose of peptide required for 50% of maximal killing (SD50), which varied from 20 pg/ml to 100 ng/ml, over four orders of magnitude for all 14 epitopes. The SD50 range for Gag/p17-SL9 was 1,000 - 20,000 pg/ml.

Immunogen HIV-1 infection
Species (MHC) human (A2)
Country United States
Assay type proliferation, Tetramer binding, T-cell Elispot
Keywords acute/early infection, characterizing CD8+ T cells, immune dysfunction
References Lichterfeld *et al.* 2004a

- HIV-1 specific CD8+ T-cells in acute and long-term nonprogressive HIV-1 infection show strong ex-vivo proliferative capacities which are rapidly lost in chronic HIV-1 infection. The loss of CD8+ T-cell function is closely linked with the loss of HIV-1 specific, IL2 secreting CD4+ T-cells. The function can be rescued in vitro and in vivo by restoring the specific CD4+ T-cell help.
- Despite being detectable at high frequencies, CD8+ T-cells specific for SL9 epitope were shown to entirely lose their proliferative capacity in chronic HIV-1 infection. This activity could be restored by co-stimulation with CD4+ T cells isolated from acute infection in an IL-2 dependent manner.

Assay type Tetramer binding, Intracellular cytokine staining
Keywords escape, TCR usage, variant cross-recognition or cross-neutralization, characterizing CD8+ T cells, HIV-2
References Lopes *et al.* 2003

- CD8+ T cells from HIV-2 infected patients had more polyclonal TCR responses than HIV-1 infected patients, who tended to have oligoclonal responses. This results in limited plasticity of T cell responses to amino acid substitutions within epitopes in HIV-1 infections. HIV-2-specific CD8+ T-cells showed a more diverse TCR usage associated with enhanced CD8 expansion and IFN-gamma production on cross-recognition of variant epitopes.
- Responses to this epitope were characterized in detail. One patient's response to SL9 A2-SLYNTVATL tetramers was shown to have only Vbeta5.1 clonotypes. The naturally-occurring HIV-2 variant: slFntvCVI, was not recognized well by this response or by the SLYNTVATL reactive CD8+ T cells in four additional A2+ HIV infected asymptomatic individuals. The subtype A variant, slFntvatl was also poorly recognized, and 4/5 Ala substitutions abrogated responses. All variants bound to HLA-A2 with higher affinity than the index peptide except slyntAatl, which was slightly reduced, so the lack of cross-reactivity must have been due to the TCR.

References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0-80% as efficiently as the index peptide, and the relatively efficiency of the variant eptiopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This epitope was one of six epitopes found to be under positive selection for escape mutations and was completely replaced by escape variants between days 327 and 635 (slYntvatl and slYnAvatl).

CTL CD8+

References Bolesta *et al.* 2005

- Immunization of transgenic mice with a codon-optimized hGagp17p24-Polp51 DNA plasmid, consisting of clusters of highly conserved CTL epitopes presented by multiple MHC class I alleles, induced 2- to 5-fold higher CD8+ T-cell responses than the corresponding full-length proteins. The modified proteins had the ribosomal frameshift deleted, as well as the potentially immunosuppressive p15, and protease and integrase. This correlated with higher protection against challenge with Gag and Pol expressing recombinant vaccinia virus. Mice immunized with the hGagp17p24-Polp51 also showed an elevated level of type 1 cytokine production as well as an increased titer of p24- and RT-specific IgG2 antibody responses.
- This was 1 of 4 A2 gag/pol epitopes tested. Transgenic mice immunized with the deleted construct induced more potent EliSpot reactions to this epitope than those immunized with full length Gag/Pol.

References Jansen *et al.* 2005

- HLA-B57 has been associated with long term non-progression in HIV+ people. The number and responsiveness of CD8 T-cells directed to different Gag peptides presented by HLA-A2, -B8 and B57 were compared. T cells specific for the HLA-B57 epitope KAFSPEVIPMF responded to a higher extent and more readily to antigenic stimulation than those specific for the A2 epitope SLYNTVATL and the B8 epitope EIYKRWII.
- In 3/4 A2 subjects that were sequenced, epitope variants dominated: 2 subjects carried slFntvatl, and the other syntIatl.
- Tetramer decay experiments indicate that the HLA-B57 peptide has a higher half-life than the A2 and B8 peptides. The authors point out that CD8+ T cells with high binding affinity may require less help.

Keywords escape, optimal epitope
References Koibuchi *et al.* 2005

- HIV-1-specific CD8 T-cell responses were persistent in the chronic phase of HIV-1 infection, although the responses to some of the epitopes declined despite the persistence of the targeted sequences in vivo. Only 4/14 epitopes were potential CTL escape variants, although strong responses to these epitopes persisted for 6 years. This indicates limited viral evolution within targeted CD8 T-cell epitopes during the chronic phase of infection.
- Elispot responses to the consensus form of this epitope, SLYNTVATL, were much more intense than to the most common variants of the epitope found over time in this individual, SLfNTiATL and SLfNTVAvL; these may be escape variants. The strong response to the consensus form persisted, despite the fact it was not observed among the autologous sequences during 6 years of chronic infection.

References Makedonas *et al.* 2005

- CD8 T-cell responses were studied in individuals who remained seronegative in spite of being mucosally (group 1) or intravenously (group 2) exposed to HIV-1. A similar proportion of subjects from each group recognized at least 1 HIV peptide, and they recognized peptides with similar cumulative intensity. The proportion of responding individuals in both groups was significantly greater than in a low-risk, negative control group. One exposed uninfected subject recognized 7 epitopes.
- HLA-A*0201 epitopes that are immunodominant in chronically infected individuals were rarely stimulatory in exposed uninfected individuals. SLYNTVATL was recognized by one HLA A2+ individual in each group (1/11 vs 1/5), while none of the exposed uninfected individuals tested responded to ILKEPVHGV. In contrast, chronically infected subjects recognized these epitopes at a frequency of 69% and 31%, respectively.

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

Epitope `SLYNTVATL`
Epitope name SL9
Subtype B
Immunogen peptide-HLA interaction
Species (MHC) human (A2)
Assay type Chromium-release assay, HLA binding
Keywords escape, TCR usage, structure, optimal epitope
References Martinez-Hackert *et al.* 2006

- Several natural SL9 variants were shown to bind comparably well to soluble HLA-A2 and D3 TCR. All variants had remarkably similar peptide conformations as evidenced by high resolution crystal structures of soluble interacting proteins. These structures were shown to differ from other peptide-MHC-TCR structures. SL9 variation was shown to be partially restricted by its context in the HIV p17 matrix protein, and the preservation of peptide conformation despite epitope variation may contribute to the persistence of SL9-mediated immune responses.

- 11 Natural variants of SLYNTVATL were tested. They were SLYNTiATL (SL9-6I), SLYNTiAvL (SL9-6I/8V), SLYNTVAvL (SL9-8V), SLfNTVATL (SL9-3F), SLfNTiAvL (SL9-3F/6I/8V), SLfNTiATL (SL9-3F/6I), SLfNTVAvL (SL9-3F/8V), SLYNaVATL (SL9-5A), SLYNsVATL (SL9-5S), SLYNaiATL (SL9-5A/6I), SLYNlVAvL (SL9-5L/8V). Only variants at P5 where Threonine is substituted by Alanine or Leucine abrogated activity, while all others variants were active. No natural variants had substitutions at P4, while P1, P2 and P9 were also conserved. 9 synthetic variants were also tested.
- This degenerate recognition of the HIV Gag epitope by CTL is different from other viral peptide-degeneracies in that several CTL clones can perform equally well in recognition of the SL9 pMHC, and there is not necessarily one dominant recognition.

Epitope name SL9
Immunogen in vitro stimulation or selection
Species (MHC) human, mouse (A2)
Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding, Chromium-release assay, Flow cytometric T-cell cytokine assay
Keywords TCR usage, variant cross-recognition or cross-neutralization
References Kan-Mitchell *et al.* 2006

- A synthetic combinatorial nonapeptide library was screened with ex-vivo-primed SL9-specific T-cells and an agonist variant of the SL9, p41 SLYNTVAaL, was identified. p41 immunized SL9-cross-reactive CTLs from donors ex vivo and double knockout mice expressing a chimeric HLA I molecule. p41-primed CTLs were also found to require less costimulation from APCs and (unlike SL9-CTLs, they required exogneous IL-2 to proliferate, suggesting they would have better immune memory) less need for exogenous IL-2 to proliferate. The loss of SL9 T-cells was minimized with p41, and the TCR clonotype was shown to be able to develop into either help-dependent or help-independent CTLs.

Assay type Flow cytometric T-cell cytokine assay, Other
Keywords HAART, ART, immunodominance, TCR usage, memory cells
References Weekes *et al.* 2006

- The effect of HAART on the population size, phenotype and function of HIV- and HCMV-specific CTL clones was analyzed. It was determined that the clonal composition of gag and env HIV-specific CD8 T-cells did not change after HAART. Following HAART, the size of immunodominant HIV-specific CD8 T-cell clones was found to diminish even with the relative preservation of functional memory responses. Maintainance of such strong functional responses implied the preferential loss of HIV-specific cells that have reduced cloning efficiency in vitro. HCMV-specific CTL clones had different kinetics and phenotypes than HIV-specific CTL clones in the same subject.

Assay type CD8 T-cell Elispot - IFNγ
Keywords binding affinity, subtype comparisons, acute/early infection
References Malhotra *et al.* 2007b

- T-cell responses to clade B Gag peptides were tested using sequences based on consensus (CON), most recent common ancestor (ANC) and center of tree (COT); as well as CON sequences from clade A, clade C and M-group Gag. It was found that Gag-specific cross-clade T-cell IFN-gamma responses are detectable during primary infection, and there was no significant difference in breadth or magnitude of responses with the different peptide sets. While several epitopes in low diversity domains are invariant across clades, other recognized variants are seen outside HLA anchor positions. T-cell immunity often tolerates conservative or semi-conservative amino acid substitutions but changes presumed to be in TCR contact sites may abrogate epitope recognition.
- This epitope, SLYNTVATL, is invariant across CON A, B, C and M-Group sequences, as well as clade B COT and ANC sequences. HLA-A02 restriction was inferred based on subject possessing appropriate HLA class I allele and prior publication.

CTL CD8+

- Cohorts of HIV-infected subjects from the US and South Africa were screened for CD8+ EliSpot responses. Tetramer assays were performed for 13 frequently targeted HIV epitopes and compared to Flu, vaccinia, and EBV epitopes assayed in non-HIV-infected subjects. HIV tetramer+ CD8 T cells expressed less CD127, and this reduction was pervasive across all epitopes and alleles tested. These results indicated impaired HIV-specific memory CD8 T cell differentiation, regardless of level of control of viremia, epitopes targeted, or HLA alleles.

- 11 HLA-A2+ (A*0201, A*0220, A*0234 or A*0236), patients' HIV were sequenced. Of 28 epitopes studied, most were conserved and elicited a subdominant CTL response. 9 epitopes in 7 proteins showed T-cell cross reaction. These epitopes were optimized to induce more immunogenic but cross-reacting responses.
- Epitopes in Gag, Pol, Env, Nef were more conserved than epitopes in shorter proteins Vpu, Vif, Vpr and Rev. Most natural epitopes were untargeted or targeted by 1 or 2 patients.
- The exact sequence of Gag 77 SLYNTVATL epitope (used as an immunodominant control), was found in only 2 patients but 6 patients had a CTL immune response to it. Thus known immunodominant epitopes were less conserved but frequently targeted.
- In most patients, this epitope sequence was different by 1 or more amino acids between positions 3-8.
- Frequent mutations in immunodominant Gag 77 may represent escape mutants emerging during infection.

- Degenerate CTL recognition of pMHC if predictable may be used to broaden vaccine reactivity. A series of epitope-position specific substitution matrices (EPSSMs) were derived by comparing observed- versus chance-amino acid substitution frequencies.
- EPSSMs showed position-specific preferences: anchor position substitutions and substitutions to P at position 1 are not well tolerated while a change to W at position 3 is favored.
- All possible single mutations in Gag SLFNTVATL were experimentally checked for tolerated versus escape substitutions. EPSSMs predicted tolerated variants very well, but in the middle region of epitopes escape mutation prediction was poor.
- From a dataset of cross-reactive variant epitopes, substitution types were identified. Variation in certain amino acid types were tolerated with strong position-preference. At anchor position 2, substitutions between basic amino acids are tolerated and at anchor 9, changes between aromatic and small hydrophobic amino acids. At all positions, the best tolerated substitutions were small hydrophobic residues for hydrophilic, suggesting spatial constraint and supporting use of side-chain volume as a predictor of degenerate recognition by CTLs.

Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding, Degranulation, CD107a and b cell surface mobilization, HLA binding
Keywords binding affinity, co-receptor
References Laugel *et al.* 2007b

- To interrogate why epitope variant-related T-cell activations differ in degree of CD8 coreceptor dependence, the authors set up a system to examine pMHCI/CD8 interactions upon binding of antigenic ligands by CTLs. 2 previous hypotheses to explain coreceptor dependence are those of Holler and Kranz suggesting it is inversely correlated to TCR/pMHCI affinity, or it is related to the geometry of TCR engagement. The former hypothesis was supported, since the CD8 coreceptor may optimize T-cell polyspecificity by improving low to intermediate binding affinities of pMHCI for TCR.
- Most studies were performed using clones specific for an hTERT or HTLV-1 peptide. SLYNTVATL was used with clones 003 and SLY-10, both derived from HIV-infected donors, to show that binding to pMHCI tetramers was greater in the presence of WT rather than null CD8 coreceptors.

Author Location Gag
Epitope `SLYNTVATL`
Immunogen HIV-1 infection, in vitro stimulation or selection
Species (MHC) human
Country United States
Assay type CD8 T-cell Elispot - IFNγ
References Garrison *et al.* 2007

- The study examined the influence of HIV-1 infection on human endogenous retroviruses (HERVs) activity and explored T cells cross-reactivity in regions of HIV-1/HERV similarity.
- T cell responses to HERV peptides were identified in HIV-1 positive individuals. There was an inverse correlation between anti-HERV T cell responses and HIV-1 viral load.
- HIV-1 epitope SLYNTVATL has a corresponding HERV peptide PMVSTPATL. These 2 peptides were used in measuring IFN-γ ELISPOT responses in HIV-1-positive and -negative individuals.

Epitope SLYNTVATLY
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A*02)
Country China
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining, Other
Keywords assay standardization/improvement, optimal epitope
References Wang *et al.* 2007c

- HLA-A11-restricted CTL epitopes in 2 male Han Chinese subjects (one ART naive and one receiving HAART) were determined. A novel epitope was discovered and 5 other putative epitopes confirmed using 425 overlapping peptides spanning the entire HIV-1 clade B proteome. By employing intracellular cytokine staining, the authors developed a new method of mapping optimal epitopes and defining their HLA restriction efficiently. In spite of its being the most common HLA type in China, A*11-restricted epitopes were recognized less frequently than other epitopes, and A*11-restricted responses formed a mean of only 13% of the responses against HIV.
- This epitope, SLYNTVATLY, was detected within overlapping peptides TGSEELRSLYNTVATLY and SLYNTVATLYCVHQRIEV as well as overlapping peptide QLQPSLQTGSEELRSLY.

Country Uganda

Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons, variant cross-recognition or cross-neutralization
References Barugahare *et al.* 2005

- T-cell immune responses were examined in HIV-1 infected Ugandans. Similar levels of cross-clade responses for Gag, Env and Nef were observed. Higher frequencies of responses in conserved regions were found for Gag within a single clade, while areas with higher viral sequence variation had fewer detectable responses. Differential interclade sequence homologies between the Gag regions did not affect the respective level of cross-clade recognition.
- The sequence contains a known A2 epitope and a known A*3002 epitope, and the subjects recognizing it each carry an HLA with a previously-defined restriction. The viral sequence isolated from the subjects was slFntvatlycvhqr, and was reactive.

Country Australia
Assay type proliferation, CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Dyer *et al.* 2008

- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.
- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- Peptide 20 (NIH ARRP Cat# 7891), SLYNTVATLYCVHQR, which contains epitopes restricted by HLA-A*02, -B*44 and -B*60 in different patients elicited the following CTL responses: (1) >2000 sfc/ million PBMC in a living non-progressor for 22+ years; (2) in another living non-progressor, responses upto 22+ years; (3) responses of >1000 sfc/million PBMC upto 22+ years for yet another living non-progressor; (4) ∼100 sfc/million PBMC upto 12 years in a low-viremic former non-progressor who succumbed to non-AIDS death; and (5) >1000 sfc/million PBMC upto 22+ years in a deceased former non-progressor who lost viremic control.

Assay type CD8 T-cell Elispot - IFNγ, CD4 T-cell Elispot - IFNγ, Th support of CTL response, Chromium-release assay
Keywords vaccine-induced epitopes, Th1, Th2
References Gavioli *et al.* 2008

- It was demonstrated that co-immunization with Tat broadens in vivo epitope-specific CD8 and CD4 responses to heterologous proteins and thus can be considered as an adjuvant. Specifically, mice immunized with Gag and Tat, responded to 11 T cell Gag epitopes, 5 more than those detected in mice vaccinated with Gag alone. Mice immunized with Env and Tat, responded to 17 T cell Env epitopes, 12 more than those detected in mice vaccinated with Env alone.
- Co-immunization with Tat specificaly drove Th1 responses and did not affect Th2 responses.
- Both Th1 and Th2 responses against Tat were no significantly affected by co-immunization with Env.
- This epitope was recognized by mice co-immunized with Gag and Tat, but not by mice immunized with Gag alone.

HXB2 Location p17 (77–94)
Author Location p17
Epitope `SLYNTVATLYCVHQRIEV`
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country Barbados, Haiti, United States
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords binding affinity, immunodominance
References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.

CTL CD8+

- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, SLYNTVATLYCVHQRIEV, had an overall frequency of recognition of 25.3% - 30.5% AA, 26.9% C, 22.7% H, 9.5% WI. This peptide is included in a 34 aa Gag-p17 highly reactive region to be used for vaccine design.

Keywords subtype comparisons, computational epitope prediction
References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- Predicted epitope based on a patient with an HLA motif embedded in a reactive peptide from a person carrying a D clade Gag.

Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding, Flow cytometric T-cell cytokine assay
Keywords vaccine-induced epitopes
References Horton *et al.* 2006b

- T cell responses during early infection in individuals previously enrolled in HIV vaccine trials were compared with those of nonvaccinated subjects.
- None of the breakthrough infections possessed vaccine-induced T-cell responses preinfection and 85-86% of vaccinees and nonvaccinees with primary infection developed T-cell responses postinfection, indicating that vaccinees' ability to mount T-cell response postinfection is not compromized by previous immunization.
- Breakthrough subjects recognized 43 T-cell epitopes, 8 of them novel, and 25% were present in the vaccine.
- This epitope was contained in the vaccine, the vaccinated patient recognized it both before and after infection.
- This epitope was contained in SLYNTVATL epitope, but PBMCs from reacting individual failed to bind the HLA-A2/SLYNTVATL tetramer. The optimal epitope turned to be newly defined LYNTVATL, restricted by HLA-C14, not previously shown to restrict HIV-1 epitopes, and T cells recognizing LYNTVATL were of high avidity.

Species (MHC) mouse
Assay type CD8 T-cell Elispot - IFNγ, CD4 T-cell Elispot - IFNγ, Th support of CTL response, Chromium-release assay
Keywords vaccine-induced epitopes, Th1, Th2
References Gavioli *et al.* 2008

- It was demonstrated that co-immunization with Tat broadens in vivo epitope-specific CD8 and CD4 responses to heterologous proteins and thus can be considered as an adjuvant. Specifically, mice immunized with Gag and Tat, responded to 11 T cell Gag epitopes, 5 more than those detected in mice vaccinated with Gag alone. Mice immunized with Env and Tat, responded to 17 T cell Env epitopes, 12 more than those detected in mice vaccinated with Env alone.
- Co-immunization with Tat specificaly drove Th1 responses and did not affect Th2 responses.
- Both Th1 and Th2 responses against Tat were no significantly affected by co-immunization with Env.
- This epitope was recognized by mice co-immunized with Gag and Tat, but not by mice immunized with Gag alone.

HXB2 Location p17 (82–91)
Author Location p17 (82–91 93TH253 subtype CRF01)
Epitope IATLWCVHQR
Epitope name G82-91
Subtype CRF01_AE
Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (A11)
Keywords HIV exposed persistently seronegative (HEPS)
References Sriwanthana *et al.* 2001

- This was a study of HIV-1 exposed persistently seronegative (HEPS) female sex workers in Chiang Mai, northern Thailand.
- HLA-A11 is very common in this population, and was enriched among the HEPS sexworkers – weak CTL responses were detected in 4/7 HEPS women, and CTL responses were found in 8/8 HIV+ controls, and 0/9 HIV- women that were not exposed.
- This epitope was weakly reactive in the HEPS study subject 265 who was HLA A2/A11.
- This epitope was strongly reactive in HIV+ study subject 053 who carried HLA-A11.

CTL CD8+

Immunogen HIV-1 infection
Species (MHC) human (A11)
Keywords subtype comparisons
References Bond *et al.* 2001

- HLA-A11 CRF01 (called subtype E in Bond *et al.*) epitopes were identified that stimulated CTL from HIV+ female sex workers (FSW) from Northern Thailand, of whom more than half were HLA-A11 positive.
- 77 possible HLA-A11 epitopes were first defined using EpiMatrix, these were screened for binding to A11 finding and 26 bound, and 12 of these were epitopes for CTL responses from 8 HLA-A11 positive FSWs, six were novel, six were previously identified.
- This epitope was predicted by the EpiMatrix method to be likely to bind to A11, and it served as an epitope in the FSWs, it was one of the six A11 epitopes that had been previously defined.
- 3/8 tested FSWs recognized this epitope.
- This epitope was not conserved in other subtypes, and exact matches were uncommon.

Epitope ATLYCVHQR
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A*11)
Country China
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining, Other
Keywords assay standardization/improvement, optimal epitope
References Wang *et al.* 2007c

- HLA-A11-restricted CTL epitopes in 2 male Han Chinese subjects (one ART naive and one receiving HAART) were determined. A novel epitope was discovered and 5 other putative epitopes confirmed using 425 overlapping peptides spanning the entire HIV-1 clade B proteome. By employing intracellular cytokine staining, the authors developed a new method of mapping optimal epitopes and defining their HLA restriction efficiently. In spite of its being the most common HLA type in China, A*11-restricted epitopes were recognized less frequently than other epitopes, and A*11-restricted responses formed a mean of only 13% of the responses against HIV.
- This putative epitope, ATLYCVHQR, was detected and confirmed within overlapping peptides TGSEELRSLYNTVATLY and SLYNTVATLYCVHQRIEV.

HXB2 Location p17 (83–91)
Author Location Gag (Henan isolate)
Epitope AVLYCVHQR
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A11)
Country China
Assay type CD8 T-cell Elispot - IFNγ
References Gong *et al.* 2006

- CTL responses were studied in treated and untreated donors from China, using Gag peptides from Henan isolate. All peptides were predicted to have A2 or A11 restriction (two of the most prominent alleles in Chinese population) and HLA restriction was further analyzed by CTL recognition in patients carrying corresponding allele. Among treated donors, HLA-A2 donors had higher CTL response than than HLA-A11 donors. Chronically infected untreated individuals had higher magnitude of CTL response than treated ones.

HXB2 Location p17 (83–94)
Author Location Gag
Epitope ATLWCVHQRIDI
Subtype CRF02_AG, CRF01_AE
Immunogen HIV-1 infection
Species (MHC) human
Country Cote D'Ivoire
Assay type CD8 T-cell Elispot - IFNγ, Other
Keywords subtype comparisons
References Aidoo *et al.* 2008

- Factors affecting cross-subtype immunity were evaluated by west Cote d'Ivoire subjects' INF-gamma ELISpot responses to OLPs from a CRF02_AG candidate vaccine, a west Kenyan subtype A virus and a Thai CRF01_AE sequence. 15 test subject sequences were primarily CRF02_AG or CRF02_AG-like, but also pure subtypes A and D. Cross-reactive responses to Gag as well as Env peptides were seen, though the response magnitude to Env was lower, perhaps due to its greater sequence variation.
- 1 subject responded to peptide ATLWCVHQRIDI from subtype CRF02_AG and to peptide ATLWCVHQRIev from subtype CRF01_AE.

HXB2 Location p17 (83–103)

Epitope TLYCVHQR
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A*1101)
Keywords subtype comparisons, TCR usage
References Fukada *et al.* 2002

- Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals.
- TLYCVHQR was found to elicit clade-specific responses in clade B (TLYCVHQR is most common, and is also common in clade A – the variant tlycvhqK is common in clade B) and clade E (tlWcvhqr is most common). TLYCVHQR was not recognized by any CTL, tlycvhqK was recognized by CTL from 1/5 B clade infected Japanese subjects, and tlWcvhqr was not recognized by CTL from infected Thai subjects, so this seems to be a B clade exclusive epitope.
- The binding of the variant peptides to HLA A*1101 was comparable, but CTL that recognized tlycvhqK did not cross-recognize the other forms, implicating TCR interaction differences.

HXB2 Location p17 (84–91)
Author Location p17 (83–91)
Epitope TLYCVHQR
Immunogen HIV-1 infection
Species (MHC) human (A11)
Keywords escape
References Harrer *et al.* 1998

- Two overlapping epitopes were recognized in a long-term survivor, restricted by two different HLA molecules, HLA-A11(TLYCVHQR) and HLA-A2 (SLYNTVATL)
- Viral sequence substitutions were present in this individual which did not affect viral replication and did not alter CTL-recognition of the A2 epitope, but reduced recognition of the A11 epitope, indicative of immune escape.
- A Q90E substitution resulted in a loss of the ability of the peptide to induce lysis, a R91K substitution was still reactive, and a R91Q substitution showed a reduced ability to stimulate lysis.

HXB2 Location p17 (84–92)

Epitope TLYCVHQRI
Epitope name TI9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A*11)
Country Australia, Canada, Germany, United States
Keywords escape, HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-A*11-associated substitution within optimally defined epitope TLYCVHQRI is at position R8, TLYCVHQrI. While TI9 recognition frequency is very low, escapes increased after 6 months.

Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay
Keywords dynamics, acute/early infection, characterizing CD8+ T cells
References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape,within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T-cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape muations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

Epitope IEIKDTKEAL
Immunogen HIV-1 infection, vaccine
Vector/Type: canarypox, canarypox prime with recombinant protein boost *Strain:* B clade BRU, B clade LAI, B clade MN, multiple epitope immunogen *HIV component:* Gag, gp120, gp41, Nef, Pol, Protease
Species (MHC) human (B40)
Assay type CD8 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords vaccine-induced epitopes, characterizing CD8+ T cells
References Horton *et al.* 2006a

- CD8+ T-cell function induced by HIV-1 immunogens and natural infection was compared. Natural infections consisted of early, chronic, and long term nonprogressors.
- B27- and B57-restricted CD8+ T cells from nonprogressors exhibited greater expansion than those restricted by other alleles, providing an explanation for the observed association between HLA-B27/B57 and control of HIV-1 infection.

HXB2 Location p17 (92–101)
Author Location Gag
Epitope IEIKDTKEAL
Epitope name IL10-B40
Subtype B, F
Immunogen HIV-1 infection
Species (MHC) human (B40)
Country Argentina
Keywords dynamics, HLA associated polymorphism
References Dilernia *et al.* 2008

- Dynamics of CTL escape mutations was studied theoretically by analyzing plasma samples from 302 subjects (collected over 20 years). HLA associated polymorphisms accumulated in a subtype-specific manner.
- Epitope IEIKDTKEAL with anchor residues at I(E)IKDTKEAL mutates to variant IEIrDTKEAL. The consensus epitope IEIkDTKEAL and a polymorphism IEIkDTKEAL increases over time.

Epitope IEIKDTKEAL
Immunogen HIV-1 infection
Species (MHC) human (B60)
References Altfeld *et al.* 2000

- This epitope was mapped by ELISPOT in a study identifying new HLA-B60 epitopes.
- B60 is present in 10-20% of the Caucasoid and very common in Asian populations.

HXB2 Location p17 (92–101)
Author Location Gag (92–101)
Epitope IEIKDTKEAL
Immunogen HIV-1 infection
Species (MHC) human (B60)
Keywords class I down-regulation by Nef
References Yang *et al.* 2002

- Nef down-modulates class I protein expression, and this study demonstrates directly that Nef-deleted HIV-1 NL-43 can be more effectively killed *in vitro* than NL-43 with an intact Nef. The effect was shown to be specific for class I presentation of epitopes, and unlike Nef, deleting Vpr did not alter CTL susceptibility of NL43 infected cells. The CTL clone 161JD27, specific for the class I B60 presented epitope IEIKDTKEAL, was one of four used in this study.

HXB2 Location p17 (92–101)
Author Location p17 (92–101 NL43)
Epitope IEIKDTKEAL
Epitope name IL10
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B60)
Assay type Chromium-release assay, CTL suppression of replication
Keywords escape
References Yang *et al.* 2003a

- Virus was cultured in the presence of CTL lines specific for 5 different epitopes (SLYNTVATL, ILKEPVHGV, IEIKDTKEAL, SEGATPQDL, and KEKGGLEGL) to study the emergence of escape mutations. Escape varied between clones for the same epitope, and between different epitopes. Gag and RT epitope escape, if it occurred at all, tended to be monoclonal and within the epitope, indicating strong fitness constraints, while the Nef epitope escape was rapid, polyconal, and sometimes the result of upstream frameshifts.
- There was one cloned cell line that recognized IEIKDTKEAL, 161JD27. After 2 weeks of passaging HIV-1 in the presence of 161JD27, no mutations were observed within the epitope in 10 sequences; one of the 10 had a single E -> K substitution 6 amino acids beyond the C-terminal end of the epitope.

HXB2 Location p17 (92–101)
Author Location Gag (92–101 B consensus)
Epitope IEIKDTKEAL
Epitope name IL10
Subtype B
Immunogen vaccine
Vector/Type: adeno-associated virus (AAV)
HIV component: gp120
Species (MHC) human (B60)
Assay type Chromium-release assay, Flow cytometric T-cell cytokine assay
Keywords dynamics, immune evasion
References Brainard *et al.* 2004

- HIV-1 gp120 is shown to suppress the ability of antigen-specific CTLs to migrate or remain at sites of high viral replication by concentration-dependent chemotaxis and fugetaxis. Directional T-cell movement is shown to depend on the interaction of the V2 and V3 loops with the CXCR4 receptor. X4

HIV-1 gp120 causes the migration of T-cells, including HIV-1 specific CTL, away from infected target cells, another potential mechanism for immune evasion.

HXB2 Location p17 (92–101)
Author Location p17 (92–101)
Epitope IEIKDTKEAL
Epitope name Gag/p17-IL10
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B60)
Assay type Chromium-release assay
Keywords binding affinity, epitope processing, TCR usage, characterizing CD8+ T cells
References Yang *et al.* 2003b

- Killing efficiency of CTLs and their ability to suppress viral replication is shown to depend more on epitope specificity than to antigenic avidity. Different clones recognizing the same epitope had similar killing efficiency despite their variation in avidity. Nef specific CTL clones tended to be most inhibitory, followed by Gag, then by RT specific clones, regardless of avidity.
- 1/14 CTL T-cell clones tested were specific for Gag/p17-IL10. Under conditions of excess peptide (100ug/ml), there was no difference in their lytic potential; all possessed similar effector capacity. Avidity was measured as the sensitizing dose of peptide required for 50% of maximal killing (SD50), which varied from 20 pg/ml to 100 ng/ml, over four orders of magnitude for all 14 epitopes. The SD50 value for the Gag/p17-IL10 clone was 8,000 pg/ml.

Assay type Intracellular cytokine staining, Other
Keywords rate of progression, escape, immune evasion
References Karlsson *et al.* 2007

- To correlate evolving HIV-1 populations with HLA-A2 restricted immune responses for epitopes in Gag, Pol, Env and Nef, 11 treatment-naive subjects were longitudinally studied. Results show that increased viral load is often associated with broad CTL responses early in infection that persist as an "immunological footprint". Conversely, early, restricted responses may help limit viral load. Phylogenetic and functional evidence of viral escape is seen in Gag, Nef and Pol. Gag and Nef show flanking epitope changes restricted by non-HLA-A2 alleles. As far as modes of viral adaptation, CTL responses were seen to develop both against static viral populations resulting in viral evolution to HLA-A2 as well as against existing mutants resulting in reselection of consensus B-like variants. This study reinforces that CTL immune responses detected are not necessarily beneficial to patients, but may be "footprints" from early effective responses that the virus has since escaped.
- A minor response was detected against an E93D variant of this epitope, dVKDTKEAL. However, CTL responses effectively eliminated cells with this viral variant. Upstream of this epitope, EVKDTKEAL, an R91G mutation was seen that is suggested to affect processing of this EL9 epitope, such that this mutant viral population evaded immune responses restricted by HLAs A*01, A*02 and B*08. Other variants detected were EiKDTKEAL, kVKDTKEAL and EVKDTKgAL.

HXB2 Location p17 (93–101)

Species (MHC) human (B*0801)
Donor MHC A*2902, B*0801, B*4403
Country United States
Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay
Keywords dynamics, immunodominance, acute/early infection, kinetics, characterizing CD8+ T cells, viral fitness and reversion
References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape,within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- There was a weak response to this epitope during acute and early infection, and the epitope sequence did not vary during the first year of the infection.

CTL CD8+

Assay type CD8 T-cell Elispot - IFNγ, HLA binding
Keywords escape, acute/early infection, variant cross-recognition or cross-neutralization
References Milicic *et al.* 2005

- CTL responses and escape were analyzed in 4 homosexual couples where blood samples were available within weeks of estimated transmission. When the recipient had the same HLA type as the donor, CTL escape variants prevented a CTL response to those epitopes in the recipient. Even when the HLA alleles were different in the transmitting couple, a single escape mutation in one epitope can abolish CTL recognition of an overlapping epitope of distinct restriction in the recipient. In an early acute infection of the donor, the precise timing of transmission determines the viral variants transmitted.
- The second donor in the study shares A*0101 and B*0801 with his partner. The epitope EVKDTKEAL has an escape variant in the donor that does not react in an Elispot assay, DvkGtkeal, but the Dvkdtkeal form was the transmitted variant. The transmitted form and EVKDTKEAL bind with equal affinity to B*0801.
- The recipient mounted a response to the Dvkdtkeal form of the epitope. The variant DvRdtkeal was detected by 32 weeks post infection.

Author Location p17 (93–101 B1 and B2)
Epitope EIKDTKEAL
Subtype B, CRF01_AE
Immunogen HIV-1 infection
Species (MHC) human (B8)
Donor MHC A3, A32, B62, B8, Cw3
Country Netherlands
Assay type Other
Keywords subtype comparisons, computational epitope prediction, superinfection
References Kozaczynska *et al.* 2007

- The influence of superinfection upon changes in HIV-1 strains was studied in a triple infected subject. While continuous expression of all three strains was observed, the LTR promoters of subtype AE had highest activity of all 3 strains, and subtype B2 had the lowest. Env-V3 sequences were present in higher numbers in strains B2 and CRF01_AE. Recombination was seen between viruses B1/B2 in gag and vpr genes.
- This HLA-B08 restricted epitope, EIKDTKEAL, varied to EvKDTKEAL in 83% of viruses in B1 within 4 years, dvKDTKEAL at the earliest time point taken in B2 with no changes over time, and EIlDTKEAL in AE at the earliest time point taken, with no changes over time. A reversion was seen in B1 to dIKDTKEAL i.e. v to I, suggesting a lack of CTL pressure on this sequence.

Assay type CD8 T-cell Elispot - IFNγ, HLA binding
Keywords HAART, ART, escape, viral fitness and reversion
References Asquith *et al.* 2006

- In order to reconcile apparent conflicts between a CTL-protective role as suggested by HLA-1 alleles associated with different rates of progression to AIDS, and a CTL non-protective role as suggested by the fact that virus clearance following ART is not impaired in advanced AIDS, a model is made that quantifies the efficiency of HIV-1-specific CTLs in vivo. As a surrogate for the actual rate of CTL-killing of infected cells, the model rests on calculating virus escape rate for an epitope and subtracting its reversion rate upon transmission to a non-restricting HLA bearing host. It is shown that CTLs recognizing a single epitope kill only 2% of productively infected CD4+ cells. The rate of CTL lysis was found to be significantly faster during primary infection than in chronic infection. However, the authors suggest that small differences in CTL lysis rate can translate into large differences in terms of absolute numbers of infected cells killed, which are likely to be clinically relevant.

- The best estimate of escape rate for this epitope, AADTGNSSQ, was found to be 0.119/day, with SE of 0.021.
- A number of mutations in this epitope (Gag AQ9) abolished recognition completely. Gag AQ9 overlapped with a second epitope (Gag NP10), and a number of mutations conferring escape from the AQ9 directed response were shown to confer escape from NP10 responses as well. This will lead to an overestimate of the importance of a single CTL response. Escape at NP10 was not quantified separately on the grounds that it was insufficiently independent from escape at AQ9.

Assay type CD8 T-cell Elispot - IFNγ
Keywords variant cross-recognition or cross-neutralization
References Zhai *et al.* 2008

- 49 ART-naive chronically HIV-1 infected Chinese subjects' CTLs were tested with 413 OLPs in IFN-gamma assays, determining optimal epitopes specific for Chinese Clade B HIV-1 sequences.
- An inverse correlation was found between CTL response and viral load.
- Targeted peptides have lower entropy than peptides that are not CTL targeted. This correlation is independent of HLA-restriction.
- Author defined epitope NSSQVSQNY elicited an immune response in Chinese HIV-1 positive subjects as part of peptide AADTGNSSQVSQNYPIV. This epitope differs from the previously described HLA-B35-restricted epitope, NSSKVSQNY, at 1 residue, NSSqVSQNY.
- 2 of the 17 HLA-B35 carriers responded to an NSSqVSQNY-containing peptide with average magnitude of CTL response of 80 SFC/million PBMC.

II-B-2 Gag p17-p24 CTL/CD8+ epitopes

HXB2 Location p17-p24 (119–3)
Author Location p17-p24
Epitope AADTGNSSQVSQNYPIV
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country Barbados, Haiti, United States
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords binding affinity, immunodominance
References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.

- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This overlapping peptide, AADTGNSSQVSQNYPIV, was differentially targeted across ethnic groups and had an overall frequency of recognition of 2.7% - 0% AA, 15.4% C, 0% H, 0% WI (P value = 0.001). HLA-A11 and -A25 were the most commonly present HLA alleles among individuals with responses to this peptide.

Country United States
Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay
Keywords dynamics, immunodominance, escape, acute/early infection, characterizing CD8+ T cells, viral fitness and reversion
References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape,within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient BORI had high viral loads and rapid CD4 decline. BORI mounted 8 detected responses. BORI did not control viral replication well, and escape mutations occurred early and in most epitopes, 6/7 that were precisely identified.
- 10 variants in the NSSQVSQNYP epitope were found in the patient BORI, the first appearing at day 35, NgSQVSQNYP, with new variants continuing to arise through day 556. This is an extremely variable epitope, and changed not only by base substitution but by insertion and deletion. All variants tested conferred some degree of escape by diminishing the CTL response.

Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons, immunodominance
References Zhao *et al.* 2007

- 46 ART-naive subjects with HIV-B infection were used to study CTL cross-responses between HIV clade B and C peptide sequences. 204/826 overlapping peptide epitopes tested were common between both clades in eliciting CTL responses that were of similar magnitude and frequency in both HIV-B and -C. Higher magnitudes and frequencies of responses were detected with peptides from Gag, Pol, Env and Nef proteins, while peptides from Rev, Vif, Vpu, Vpr and Tat were recognized less often.
- 27 peptides from immunodominant regions of higher inter-clade homology in Gag, Nef, Pol, Vpr, Env and Vif were found to be common between both clades in eliciting the greatest CTL responses. Although these 27 peptides differed by up to 39% between clades, CTL responsiveness was not affected.
- Cross-recognized peptides had a lower entropy of recognition than clade-B specific variants, suggesting that published conserved clade-B sequences are also more conserved between clades. Consensus sequences therefore occurred in virus regions of low intra-clade entropy and high inter-clade homology.
- 18/27 highly immunogenic clusters were previously reported by Frahm et al. [J. Virol. 78:2187-2200 (2004)].
- This peptide, EKIRLRPGGKKkYrLKHL differs from the consensus C sequence KIRLRPGGKKhYmLKHL at 2 amino acid positions, i.e. by 11.1%.

Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords epitope processing, immune evasion, viral fitness and reversion, HLA associated polymorphism
References Honeyborne *et al.* 2007

- To determine whether HLA-B*13-restricted CTL responses could partially explain low viremic loads in patients, a cohort of chronic C-clade infected subjects was studied. 6 novel B*13-restricted CTL epitopes were defined from both C- and B-clade viruses, 3 of which were within Gag. B*13-restricted CTL responses correlated with lower viremia, with most immunity targeted against Gag epitopes (p15, p17, p24). Gag epitope escape variants may exact a high viral fitness cost, mutations being seen within and around the optimal epitope.
- Variants of this epitope, VQNLQGQMV, were seen at positions 4, 7 and 9. A closer look at sequences just upstream and downstream of the optimal epitope, QNPIVQNLQGQMVHQaiSPRTLNAWVKVEE, show that residues 146 and 147 show most change. In association with HLA-B*57/5801, the epitope ISPRTLNAW (Gag, 147-155)may vary; whilst the HLA-B*1510-restricted epitope VHQAISPRTL (Gag, 143-152) varies at A146P to VHQpISPRTL. Such mutations may be seen >= 4 residues downstream of the epitope C terminus.

Epitope `QMVHQAISPR`
Immunogen HIV-1 infection
Species (MHC) human (A3 supertype)
Keywords supertype, rate of progression
References Propato *et al.* 2001
- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind 3/5 HLA-A3 supertype alleles (A*0301, A*1101, A*3101, A*3301 and A*6801).

HXB2 Location p24 (9–23)

Epitope `QMVHQSLSPRTLNAW`
Subtype A, D
Immunogen HIV-1 infection
Species (MHC) human
Donor MHC A*3002, A*6801, B*5703, B*5802; A*3001, A*6601, B*5801, B*5802
Country Uganda
Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons, variant cross-recognition or cross-neutralization
References Barugahare *et al.* 2005
- T-cell immune responses were examined in HIV-1 infected Ugandans. Similar levels of cross-clade responses for Gag, Env and Nef were observed. Higher frequencies of responses in conserved regions were found for Gag within a single clade, while areas with higher viral sequence variation had fewer detectable responses. Differential interclade sequence homologies between the Gag regions did not affect the respective level of cross-clade recognition.
- The sequence contains a known B7/B8 epitope, but the subjects recognizing it are B7- and B8-negative. The viral sequences isolated from the subjects were qmThqNlsprtlnaw and qmvhqAlsprtlnaw, and the peptide was recognized.

Epitope `QMVHQAISPRTLNAW`
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Bailey *et al.* 2008
- This is the first documentation of transmission of HIV-1 from a patient who developed AIDS (Progressor) to an Elite Suppresssor (ES).
- Both patients are HLA-B*5703-positive. The ES also has B*27 allele. Escape mutations in HLA-B*57-restricted epitopes were present in both patients, suggesting that they by themselves cannot explain the difference in the outcomes.
- The study concluded that viral replication is controlled in ES by at least two mechanisms: (i) direct inhibition of viral replication by polyfunctional HIV-1 specific CD8+ T cells that proliferate in response to autologous viral peptides; (ii) selection for and maintenance of escape mutations that have a negative impact on viral fitness.
- This epitope elicited IFN-γ response in the Progressor. Both patients had A146P, I147L substitutions.

HXB2 Location p24 (10–18)
Author Location Gag (144–152 SF2)
Epitope `MVHQAISPR`
Subtype B
Immunogen HIV-1 infection, computer prediction
Species (MHC) human (A*3303)
Assay type Chromium-release assay
Keywords binding affinity, computational epitope prediction
References Hossain *et al.* 2003
- HLA-A*3303 is a common HLA allele in east and southeast Asia. Pol, Gag and Nef SF2 proteins were scanned for potential A*3303 epitopes. 99 potential epitopes were synthesized, and 52/99 bound to A*3303. Six of these served as peptide-targets for lysis by PBMC from infected individual, and clones derived from 4 of these 6 could lyse HIV-vaccinia infected target cells, indicating proper processing.
- This epitope is one of the 4 that are properly processed.

Author Location Gag
Epitope MVHQSMSPRTLNAW
Subtype A, CRF02_AG
Immunogen HIV-1 infection
Species (MHC) human
Country Cote D'Ivoire
Assay type CD8 T-cell Elispot - IFNγ, Other
Keywords subtype comparisons
References Aidoo *et al.* 2008

- Factors affecting cross-subtype immunity were evaluated by west Cote d'Ivoire subjects' INF-gamma ELISpot responses to OLPs from a CRF02_AG candidate vaccine, a west Kenyan subtype A virus and a Thai CRF01_AE sequence. 15 test subject sequences were primarily CRF02_AG or CRF02_AG-like, but also pure subtypes A and D. Cross-reactive responses to Gag as well as Env peptides were seen, though the response magnitude to Env was lower, perhaps due to its greater sequence variation.
- 2 subjects responded to peptide MVHQSMSPRTLNAW from subtype CRF02_AG, and 1 of the 2 responded to peptide MVHQplSPRTLNAW from subtype A.

HXB2 Location p24 (11–20)
Author Location (C consensus)
Epitope VHQAISPRTL
Subtype C
Immunogen HIV-1 infection
Species (MHC) human (B*1510)
Country South Africa
Assay type CD8 T-cell Elispot - IFNγ
Keywords characterizing CD8+ T cells
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location p24 (11–20)
Author Location (C consensus)
Epitope VHQAISPRTL
Subtype C
Immunogen HIV-1 infection
Species (MHC) human (B*1510)
Country South Africa
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, optimal epitope
References Kiepiela *et al.* 2007

- A comprehensive analysis of 160 class I T cell responses in 578 individuals from KwaZulu-Natal, South Africa was performed. Gag-specific responses were associated with lowering viremia, while Env, accessory and regulatory protein-specific responses were associated with higher viremia.
- VHQAISPRTL is an optimal epitope.

HXB2 Location p24 (11–20)

Keywords subtype comparisons, immunodominance
References Goulder *et al.* 2000a

- The CTL-dominant response was focused on this epitope in an HIV+ Haitian living in Boston, who was A34/68 B57/71 Cw3/7 – this epitope fell outside the most recognized peptides in the study.
- Three peptides GSEELRSLYNTVATL (p17 residues 71-85), SALSEGATPQDLNTMLNTVG (p24 41-60), and WEKIRLRPGGKKKYKLK (p17 16-30) contained the dominant Gag-specific epitope in 31/44 B-clade infected individuals from Boston who showed Gag-CTL responses.
- Five peptides RLRPGGKKHYMIKHLVW (p17 20-36), ELRSLYNTVATLYCV (p17Gag 74-88), SALSEGATPQDLNTMLNTVG (p24 41-60), FRDYVDRFFKTLRAEQA (p24

161-177), and SILDIKQGKEPFRDY (p24 149-164) contained dominant Gag-specific epitopes in 32/37 C-clade infected subjects from South Africa.

HXB2 Location p24 (11–25)
Author Location p24 (11–25 HXB2)
Epitope `VHQAISPRTLNAWVK`
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Assay type T-cell Elispot
Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 29% of the study subjects, and it was the third most frequently recognized peptide.

Keywords escape, immune evasion, optimal epitope
References Liu *et al.* 2006b

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.
- Amino acid site in the third position potentially experienced positive selection. QAlSPRTLNAW CTL escape mutant was found.

Keywords rate of progression, escape, immune evasion
References Karlsson *et al.* 2007

- To correlate evolving HIV-1 populations with HLA-A2 restricted immune responses for epitopes in Gag, Pol, Env and Nef, 11 treatment-naive subjects were longitudinally studied. Results show that increased viral load is often associated with broad CTL responses early in infection that persist as an "immunological footprint". Conversely, early, restricted responses may help limit viral load. Phylogenetic and functional evidence of viral escape is seen in Gag, Nef and Pol. Gag and Nef show flanking epitope changes restricted by non-HLA-A2 alleles. As far as modes of viral adaptation, CTL responses were seen to develop both against static viral populations resulting in viral evolution to HLA-A2 as well as against existing mutants resulting in reselection of consensus B-like variants. This study reinforces that CTL immune responses detected are not necessarily beneficial to patients, but may be "footprints" from early effective responses that the virus has since escaped.
- One patient showed an I147L mutation in the HLA-B57 restricted epitope ISPRTLNAW, to lSPRTLNAW.

Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding
Keywords escape, viral fitness and reversion, drug resistance
References Bailey *et al.* 2007

- In this study the entire HIV-1 genome was analyzed before and after virologic escape for the first time and escape mutations were temporarily associated with an increased viremia in an otherwise B*57-elite controller of viral load. It is suggested that HLA-B*57-restricted CTL mutations were the major cause of escape because other multiple drug resistance mutations in Pol and RT (M184V and T215Y) did not result in a marked increase in viral replication capacity in vitro.
- CTLs detecting this Gag epitope, ISPRTLNAW, were detectable and levels remained unchanged over 20 months. Most clones developed an A-P mutation in the position preceding IW9 which is a well-characterized processing escape mutation.

Epitope name IW9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B*57)
Country Canada
Keywords HLA associated polymorphism
References Brumme *et al.* 2008b

- A large chronically infected, treatment naïve cohort was studied to identify and organize HLA I-associated polymorphisms in Gag into an immune escape map. Insertion polymorphisms at p17 C-terminus were associated with HLA-B*44, -A*32, -C*05. Inverse correlations were found between number to HLA-associated sites and pVL as well as escaped Gag residues and pVL. pVL positively correlates with CD4 T-cell count. No enrichment for HLA-associated polymorphisms are seen at anchor residues, showing that CTL escape is primarily not through abrogation of peptide-HLA binding.
- Gag p24 IW9 is B*57-restricted and an HLA-B*57-associated escape mutation at codon 147 resides within it.

HXB2 Location p24 (15–23)
Author Location p24 (147–155)
Epitope `ISPRTLNAW`
Epitope name IW9
Immunogen HIV-1 infection
Species (MHC) human (B*57)
Country Kenya
Keywords epitope processing, escape
References Peters *et al.* 2008a

- Gag sequences from 468 HIV-1 positive sex workers from the Kenyan Pumwani cohort were analyzed to bioinformatically identify positively selected residues that could be related to antigen processing. Mutation effects on disease progression were followed by mean CD4 counts. This method is also one way of identifying potential CTL epitopes and classifying them.
- A Gag positive selection map was generated and sites were classified as beneficial or harmful to HIV. They were correlated to antigen processing (proteasomal cleavage), antigen presentation (TAP transport efficiency) and T-cell receptor binding.
- p17 and p24's structural constraints limited their diversity, while p7-p1-p6 showed a higher average entropy.

CTL CD8+

- HLA-B*57-restricted IW9, ISPRTLNAW, has mutation A146P i.e. ISPRTLNpW, that prevents N-terminal trimming by ER aminopeptidase I. Another mutation, I147L, i.e. lSPRTLNAW, is significantly associated with dropping CD4 counts. Double mutants, lSPRTLNpW, occured in 11% of the patients who were HLA-B*5703 progressors.

Epitope ISPRTLNAW
Epitope name ISW9
Subtype C
Immunogen HIV-1 infection
Species (MHC) human (B*57, B*5801)
Country South Africa
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, escape, viral fitness and reversion, compensatory mutation
References Chopera *et al.* 2008

- Transmission of HIV-1-escape variants from individuals with protective HLA-B*57/-B*5801 alleles to those without these alleles was studied to determine if infection with such replication-deficient mutants offered any advantage to the new host. Dependency between slower rate of disease progression in the newly infected subject and protective genotype of the infecting individual was suggested.
- 2 Gag polymorphisms in epitopes ISW9 (ISPRTLNAW) and TW10 (TSTLQEQIAW) associated with low viral loads and high CD4+ counts during acute and chronic infection were followed in HLA-B*57 and HLA-B*5801 negative subjects for minimum 12 months. A correlation was suggested between rate of disease progression and genotype of the individual HLA-B*57/-B*5801 positive) from whom virus was contracted.
- Epitope ISW9, ISPRTLNAW, was found with A146X mutation adjacent to ISW9, an epitope processing mutation in 9/21 subjects. 2 of 9 individuals carrying substitutions A146X and T242N had compensating H219Q to partially restore replicative fitness. While A146X/T242N+ subjects show no significant difference from A146X/T242N- subjects in magnitude or breadth of CTL response to other Gag-epitope-containing peptides, they do have lower viremia.
- Other variations found in ISW9 were (p)mSPRTLNAW(V), (p)ISPRTLNAW(V), (p)lSPRTLNAW(V) and (s)lSPRTLNAW(V).

Immunogen peptide-HLA interaction
Species (MHC) human (B*5701)
Assay type Tetramer binding
Keywords binding affinity
References Gillespie *et al.* 2007

- MHC can exert a protective effect on HIV-1 disease progression by the interaction of MHC Class I molecules with Killer Inhibitory Receptors (KIR) of the innate immune system. Here, KIR3DS1, a putative stimulatory receptor and allele of the inhibitory KIR3DL1, is studied. Bw4 MHC Class I proteins were implicated in this KIR's ligand specificity, but the authors were unable to generate binding of Bw4Ile80 tetramers in complex with epitopes to KIR3DS1 transiently expressed on 293-T cells, using a panel of HIV-epitopes differing at p7 and p8.
- This epitope, ISPRTLNAW (MHC Class I restriction, serotype Bw4Ile80) complexed with MHC B*5701 as a tetramer was unable to bind KIR3DS1 at 4, 20 and 37C.

Assay type CD8 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords rate of progression, TCR usage, variant cross-recognition or cross-neutralization, characterizing CD8+ T cells
References Turnbull *et al.* 2006

- Functional cross-reactivity of CD8 responses to HIV-1 epitopes restricted by different HLA-alleles was analyzed. It was shown that epitope-specific responses with the most efficient cross-recognition were strongly associated with delayed disease progression. Variant-cross recognition efficiency was linked to the dominant TCRs used for epitope recognition. Epitopes restricted by the same HLA-allele did not show similar variant cross-recognition efficiency, suggesting that the rate of disease progression might be associated with the quality of responses to certain critical epitopes.
- This epitope, B57-ISP, is very strongly associated with delayed progression to AIDS, and its natural variants were less efficiently cross-recognized. Its alanine-substituted variants were poorly cross-recognized.

References Malhotra *et al.* 2007b

- T-cell responses to clade B Gag peptides were tested using sequences based on consensus (CON), most recent common ancestor (ANC) and center of tree (COT); as well as CON sequences from clade A, clade C and M-group Gag. It was found that Gag-specific cross-clade T-cell IFN-gamma responses are detectable during primary infection, and there was no significant difference in breadth or magnitude of responses with the different peptide sets. While several epitopes in low diversity domains are invariant across clades, other recognized variants are seen outside HLA anchor positions. T-cell immunity often tolerates conservative or semi-conservative amino acid substitutions but changes presumed to be in TCR contact sites may abrogate epitope recognition.
- Epitope sequences for this eptiope, IW9 are invariant between CON B, COT B, ANC B and M-group. Cross-recognition is seen with both C- and A-clades. Anchor residues are at positions 2 and 9; while the A-clade variant contains a change at position 1 to lSPRTLNAW. HLA-B57 restriction was inferred based on subject possessing appropriate HLA class I allele and prior publication.

Keywords HAART, ART, escape, viral fitness and reversion
References Asquith *et al.* 2006

- In order to reconcile apparent conflicts between a CTL-protective role as suggested by HLA-1 alleles associated with different rates of progression to AIDS, and a CTL non-protective role as suggested by the fact that virus clearance following ART is not impaired in advanced AIDS, a model is

made that quantifies the efficiency of HIV-1-specific CTLs in vivo. As a surrogate for the actual rate of CTL-killing of infected cells, the model rests on calculating virus escape rate for an epitope and subtracting its reversion rate upon transmission to a non-restricting HLA bearing host. It is shown that CTLs recognizing a single epitope kill only 2% of productively infected CD4+ cells. The rate of CTL lysis was found to be significantly faster during primary infection than in chronic infection. However, the authors suggest that small differences in CTL lysis rate can translate into large differences in terms of absolute numbers of infected cells killed, which are likely to be clinically relevant.
- The best estimate reversion rate for this epitope, ISPRTLNAW, was found to be -0.005/day with a SE of 0.
- An A14P substitution in the flanking region of this B57-restricted epitope prevented correct processing of the epitope and conferred CTL escape. On transfer of this variant to an HLA-B57- individual, the frequency of the escape mutant actually increased giving a negative reversion rate of -0.005/day. This is consistent with in vitro replication and competition assays as well as with the accumulation of this mutation in the population, suggesting that A14P does not carry a fitness cost.

Keywords computational epitope prediction
References Schellens *et al.* 2008

- Peptide prediction programs based on MHC binding, proteasomal cleavage and TAP transport were applied to select novel epitopes absent from the Los Alamos HIV database. 22 novel epitopes were tested by IFN-gamma ELISpot and 19 (11 HLA-B27 restricted, 8 HLA-B57 restricted) induced strong positive responses.
- Magnitude of response generated was similar to that of previously identified epitopes, but the number of individuals responding was lower. This could be explained by less stringent HLA-typing of subjects and perhaps high sequence variability within these novel epitopes.
- IW9(Gag), ISPRTLNAW, is a known HLA-B57-restricted epitope used as a positive control for eliciting CTL IFN-gamma response.

Keywords epitope processing, responses in children, mother-to-infant transmission, escape
References Feeney *et al.* 2005

- Escape mutations in TW10 and other B57-restricted epitopes were shown to arise early in infants following perinatal infection. Some escape variants were likely to have been transmitted vertically, from HLA-B57/5801 positive HIV-1 infected mothers, while others arose during infancy in cases where the children inherited the B57/5801 allele paternally. In contrast to adults, the majority of children showed a robust response to the escape variants, suggesting that infants are able to mount functional immune responses and drive immune escape and that a developing immune system may exhibit greater plasticity in recognizing viral variants.
- ISPRTLNAW was recognized more often in children than in adults, and was the most frequently recognized B57 epitope in children. Escape variants of this epitope arose in 2 children: an A->P change proximal to the epitope, pISPRTLNAW, and and I1L change, lSPRTLNAW. In both cases the mother carried AISPRTLNAW.

Keywords subtype comparisons, immunodominance
References Geldmacher *et al.* 2007a

- 56 ART-naive subjects were studied to assess whether T-cell responses to Gag and Nef are biased towards infecting subtype recognition, in a setting of epidemic consisting of subtypes A,C and D and their recombinant forms. The infecting subtype was determined by multi-region hybridization assay. Overlapping 15-mer isolate-based Gag and Nef peptide sets representative of local subtypes were used. The best recognized epitope variant in terms of magnitude and breadth corresponded to infecting subtype, in this case usually type-C. Hot spots of CTL recognition in Gag were in p24, p17 and p15; hotspots against Nef were in its central, conserved region.
- Epitope variants iSPRTLNAW and lSPRTLNAW were studied as peptide sequences HQA-iSPRTLNAW-YKV (subtype C), QMVHQS-lSPRTLNAW (subtype A) and QMVHQA-lSPRTLNAW (subtype A) with 20% responders. Associated HLAs frequently expressed within the studied cohort are listed in the study as B57, B58.

References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype D Gag. The autologous epitope sequence had an I1L change, lSPRTLNAW.

References Reche *et al.* 2006

- 25 CTL epitopes with sequence conservation were studied. Population protection coverage (PPC) for 5 different ethnic groups in the US was estimated by combining HLA binding predictions and known HLA frequencies. HIV-1-naive individuals mounted a better response to the epitope pools than HIV-1 infected individuals.
- A more detailed evaluation of HIV-naive T-cell responses was undertaken, limiting the study to only those peptides that are restricted to A*0201. Though the peptides could cross-recognize and bind different HLA, they were able to specifically lyse only cells of the same (A*0201) HLA-restriction.

Thus, the CTL response was less degenerate than peptide binding to MHC.

- In addition to published restriction above, epitope SPRTLNAWV was predicted to be restricted by HLA B*0702, B*3501, B*5102, B*5103, B*5301, B*5401 and B*5502 as well.

Keywords rate of progression
References Dyer *et al.* 2008

- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.
- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS.

- Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- Peptide 38 (NIH ARRP Cat# 7909), PRTLNAWVKVVEEKA, which contains an epitope restricted by HLA-A2 elicited CTL response for 20+ years in a deceased former non-progressor who lost viremic control of disease.

References Corbet *et al.* 2003

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This peptide was an intermediate A2 binder, and induced CTL responses in mice. Responses were detected in 1/17 HIV+ HLA-A2 subjects.

References Thorn *et al.* 2007

- 11 HLA-A2+ (A*0201, A*0220, A*0234 or A*0236), patients' HIV were sequenced. Of 28 epitopes studied, most were conserved and elicited a subdominant CTL response. 9 epitopes in 7 proteins showed T-cell cross reaction. These epitopes were optimized to induce more immunogenic but cross-reacting responses.
- Epitopes in Gag, Pol, Env, Nef were more conserved than epitopes in shorter proteins Vpu, Vif, Vpr and Rev. Most natural epitopes were untargeted or targeted by 1 or 2 patients.
- Gag 150 RTLNAWVKV, a very conserved epitope, was found in all 11 patients but only 1 had a CTL immune response to it. It was anchor-optimized to Gag150 (2L)mod, RlLNAWVKV, resulting in a strong immunogen with cross-reaction to the natural form.

References Fomsgaard *et al.* 2008

- Comparative genetic and immunological study was conducted of two subjects - patient DK1 with no viremia for >10 years after transient ART and despite continued sexual contact with patient UG1 (his wife) who was an HIV-1-positive non-controller.
- DK1 and UG1 shared most crossover points of recombination but while DK1 had subtype A1 Env, UG1's Env was subtype D. In the shared subtype A1/D regions, homology between the patients' sequences was 98%.
- Out of 23 conserved HLA-A02 epitopes, HLA-A2+ DK1 produced CTL response and IFN-gamma response only to epitope ILKEPVHGV.
- DK1 produced neutralizing antibody only to homologous isolates. It is suggested that early, transient ART may have resulted in full control of viremia and disease via the very narrow specific CTL response and neutralizing antibody.
- Despite carrying HLA-A2, DK1 did not respond to HLA-A2 Gag epitope RTLNAWVKV, though it did elicit response in a cohort of 11 other HIV-1 + HLA-A2+ patients.

Assay type Intracellular cytokine staining, Other
Keywords rate of progression, escape, immune evasion
References Karlsson *et al.* 2007

- To correlate evolving HIV-1 populations with HLA-A2 restricted immune responses for epitopes in Gag, Pol, Env and Nef, 11 treatment-naive subjects were longitudinally studied. Results show that increased viral load is often associated with broad CTL responses early in infection that persist as an "immunological footprint". Conversely, early, restricted responses may help limit viral load. Phylogenetic and functional evidence of viral escape is seen in Gag, Nef and Pol. Gag and Nef show flanking epitope changes restricted by non-HLA-A2 alleles. As far as modes of viral adaptation, CTL responses were seen to develop both against static viral populations resulting in viral evolution to HLA-A2 as well as against existing mutants resulting in reselection of consensus B-like variants. This study reinforces that CTL immune responses detected are not necessarily beneficial to patients, but may be "footprints" from early effective responses that the virus has since escaped.

References Reche *et al.* 2006

- 25 CTL epitopes with sequence conservation were studied. Population protection coverage (PPC) for 5 different ethnic groups in the US was estimated by combining HLA binding predictions and known HLA frequencies. HIV-1-naive individuals mounted a better response to the epitope pools than HIV-1 infected individuals.
- A more detailed evaluation of HIV-naive T-cell responses was undertaken, limiting the study to only those peptides that are restricted to A*0201. Though the peptides could cross-recognize and bind different HLA, they were able to specifically lyse only cells of the same (A*0201) HLA-restriction. Thus, the CTL response was less degenerate than peptide binding to MHC.
- In addition to the published restriction above epitope TLNAWVKVI, was predicted to be restricted by A*0201, A*0202, A*0203, A*0204, A*0206.

References Bolesta *et al.* 2005

- Immunization of transgenic mice with a codon-optimized hGagp17p24-Polp51 DNA plasmid, consisting of clusters of highly conserved CTL epitopes presented by multiple MHC class I alleles, induced 2- to 5-fold higher CD8+ T-cell responses than the corresponding full-length proteins. The modified proteins had the ribosomal frameshift deleted, as well as the potentially immunosuppressive p15, and protease and integrase. This correlated with higher protection against challenge with Gag and Pol expressing recombinant vaccinia virus. Mice immunized with the hGagp17p24-Polp51 also showed an elevated level of type 1 cytokine production as well as an increased titer of p24- and RT-specific IgG2 antibody responses.
- This was 1 of 4 A2 gag/pol epitopes tested. Transgenic mice immunized with the deleted construct induced more potent EliSpot reactions to this epitope than those immunized with full length Gag/Pol.

References Blondelle *et al.* 2008

- To identify immunogenically optimized peptide epitopes for use in vaccines, two strategies were used. The first studied rare mutant epitopes that were effective in generating a cross-reactive immune response against a range of mutants. The second method was to use a synthetic combinatorial library of peptides and screen for highly effective responses against one epitope (TV9, TLNAWVKVV) and its mutants. Candidate epitopes were tested in HLA-A2 transgenic mice as well as ex vivo human lymphocytes.
- Natural TV9 mutants tested in transgenic HLA-A*02 mice showed the following responses - the common mutant V9I, TLNAWVKVi was less immunogenic and had low cross-reactivity. TLNAWVKaV (most cross-reactive) and TLNAWVKai were highly immunogenic and cross-reactive to the consensus. Other rare mutants were TfNAWVKVV, TLNAWVKVl, TLNArVKVV, TLNAWiKVi, TsNAWVKVi and TLNAWVKcV.
- Synthetic library mimics chosen were TvNAWnKdV, TLNAWwyaV, TLNAWnKaV, TLNAWnyaV (most immunogenic), TLNAWwydV, TvNAWnyaV, TvNAWwyaV, TvsAvwydV, TLNAWnydV, TLsAWnyaV, TLNAWwKaV, TLsAvwKaV, TLsAWwyaV, TLsAWnydV, TvNAWwKdV and TLNAvwKaV.

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape,within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- There was a weak response to this epitope during acute and early infection, and the epitope sequence did not vary during the first year of the infection.

Keywords characterizing CD8+ T cells
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location p24 (24–32)
Author Location (C consensus)
Epitope `VKVIEEKAF`
Subtype C
Immunogen HIV-1 infection
Species (MHC) human (B*1503)
Country South Africa
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, optimal epitope
References Kiepiela *et al.* 2007

- A comprehensive analysis of 160 class I T cell responses in 578 individuals from KwaZulu-Natal, South Africa was performed. Gag-specific responses were associated with lowering viremia, while Env, accessory and regulatory protein-specific responses were associated with higher viremia.
- VKVIEEKAF is an optimal epitope.

Epitope VKVIEEKAF
Immunogen
Species (MHC) human (B*1503)
Keywords optimal epitope
References Llano *et al.* 2009

- C. Brander notes that this is an B*1503 epitope.

HXB2 Location p24 (24–32)
Author Location p24
Epitope VKVVEEKAF
Subtype B, C
Immunogen HIV-1 infection
Species (MHC) human (B*1503)
Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons, rate of progression, immunodominance
References Frahm *et al.* 2006

- CTL responses restricted by HLA-B*1503 were analyzed in HIV-1 subtype B and C-infected patients. An association between HLA-B*1503 and reduced viral loads in individuals infected with clade B was found. No such correlation was found in clade C infected subjects inspite of the same immunodominant responses in subjects infected with either subtype. Clade B viral control was associated with several subdominanat CTL epitopes lacking in clade C, suggesting that subdominant responses can contribute to viral control.
- VKVVEEKAF of clade B is a potential HLA-B*1503-restricted epitope, with epitope VKViEEKAF found in clade C.

HXB2 Location p24 (24–32)
Author Location Gag
Epitope VKVIEEKAF
Subtype C
Immunogen HIV-1 infection
Species (MHC) human (B*1503)
Country South Africa
Assay type CD8 T-cell Elispot - IFNγ
Keywords variant cross-recognition or cross-neutralization
References Chopera *et al.* 2008

- Transmission of HIV-1-escape variants from individuals with protective HLA-B*57/-B*5801 alleles to those without these alleles was studied to determine if infection with such replication-deficient mutants offered any advantage to the new host. Dependency between slower rate of disease progression in the newly infected subject and protective genotype of the infecting individual was suggested.
- HLA-B*1503-restricted epitope VKVIEEKAF, within peptide PRTLNAWVKVIEEKAF was able to elicit CTL response in a wild type virus-carrying subject.

HXB2 Location p24 (24–32)
Author Location p24 (17–32)
Epitope VKVVEEKAF
Immunogen HIV-1 infection, in vitro stimulation or selection
Species (MHC) human (B*1503)
Country United States
Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay, HLA binding
Keywords binding affinity, immunodominance, dendritic cells
References Schaubert *et al.* 2007

- CTL responses to the rarely recognized, subdominant HLA-A2-restricted Gag p24 epitope TLNAWKVV (TV9) were studied since its functional sensitivity and viral suppression is relatively high compared to other, dominant HLA-A2-restricted HIV-1 epitopes. Subdominant CTL responses to TV9 were not related to immunogenicity, availability of cognate TCR repertoires or HLA-epitope binding avidity.
- 14 of 24 HLA-A2+ subjects recognizing oligopeptide PRTLNAWVKVVEEKAP, most likely directed their response against the HLA-B*1503-restricted VKVVEEKAF epitope found within this oligopeptide.

HXB2 Location p24 (24–32)
Author Location p24
Epitope VKVIEEKAF
Epitope name VF9(p24)
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B15)
Country China
Assay type CD8 T-cell Elispot - IFNγ
Keywords non-susceptible form
References Zhai *et al.* 2008

- 49 ART-naive chronically HIV-1 infected Chinese subjects' CTLs were tested with 413 OLPs in IFN-gamma assays, determining optimal epitopes specific for Chinese Clade B HIV-1 sequences.
- An inverse correlation was found between CTL response and viral load.
- Targeted peptides have lower entropy than peptides that are not CTL targeted. This correlation is independent of HLA-restriction.
- The tested peptide sequence, PRTNAWVKVVEEKAF, contains a variant, VKVvEEKAF to the previously described HLA-B15 epitope VKVIEEKAF. None of the 21 HLA-B15 carriers responded to the variant VKVvEEKAF.

Epitope KVVEEKAFSPEVIPM
Immunogen HIV-1 infection
Species (MHC) human (B44)
Donor MHC A2, A32, B44, B7
Country Australia
Assay type proliferation, CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Dyer *et al.* 2008

- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.

CTL CD8+

- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- Peptide 40 (NIH ARRP Cat# 7911), KVVEEKAFSPEVIPM, which contains an epitope in different patients that is HLA-B44 restricted elicited the following CTL responses: (1) 19+ years in a living non-progressor and (2) 22+ years in a former non-progressor who succumbed to loss of viremic control.

HXB2 Location p24 (26–40)
Author Location Gag
Epitope VIEEKAFSPEVIPMF
Subtype A, CRF02_AG, CRF01_AE
Immunogen HIV-1 infection
Species (MHC) human
Country Cote D'Ivoire
Assay type CD8 T-cell Elispot - IFNγ, Other
Keywords subtype comparisons
References Aidoo *et al.* 2008

- Factors affecting cross-subtype immunity were evaluated by west Cote d'Ivoire subjects' INF-gamma ELISpot responses to OLPs from a CRF02_AG candidate vaccine, a west Kenyan subtype A virus and a Thai CRF01_AE sequence. 15 test subject sequences were primarily CRF02_AG or CRF02_AG-like, but also pure subtypes A and D. Cross-reactive responses to Gag as well as Env peptides were seen, though the response magnitude to Env was lower, perhaps due to its greater sequence variation.
- 1 subject responded to peptide VIEEKAFSPEVIPMF from subtypes A and CRF02_AG; and to peptide VvEEKgFnPE-VIPMF from subtype CRF01_AE.

HXB2 Location p24 (27–36)

Epitope `KAFSPEVI`
Epitope name KAF8
Immunogen HIV-1 infection
Species (MHC) human (B*57)
Country Kenya
References Peters *et al.* 2008a

- Gag sequences from 468 HIV-1 positive sex workers from the Kenyan Pumwani cohort were analyzed to bioinformatically identify positively selected residues that could be related to antigen processing. Mutation effects on disease progression were followed by mean CD4 counts. This method is also one way of identifying potential CTL epitopes and classifying them.
- A Gag positive selection map was generated and sites were classified as beneficial or harmful to HIV. They were correlated to antigen processing (proteasomal cleavage), antigen presentation (TAP transport efficiency) and T-cell receptor binding.
- p17 and p24's structural constraints limited their diversity, while p7-p1-p6 showed a higher average entropy.
- HLA-B*5703 correlating mutant A163G, KgFSPEVI, of KAF8 is associated with an increased CD4 count. Since the mutant epitope is still presented efficiently, it continues to correlate with slow disease progression.

References Bailey *et al.* 2008
- This is the first documentation of transmission of HIV-1 from a patient who developed AIDS (Progressor) to an Elite Supp-presssor (ES).
- Both patients are HLA-B*5703-positive. The ES also has B*27 allele. Escape mutations in HLA-B*57-restricted epitopes were present in both patients, suggesting that they by themselves cannot explain the difference in the outcomes.
- The study concluded that viral replication is controlled in ES by at least two mechanisms: (i) direct inhibition of viral replication by polyfunctional HIV-1 specific CD8+ T cells that proliferate in response to autologous viral peptides; (ii) selection for and maintenance of escape mutations that have a negative impact on viral fitness.
- In this epitope, the ES had A163S substitution (KsFSPEVIPMF), which is very rare in B clade isolates, and the Progressor had A163N substitution (KnFSPEVIPMF). A163S substitution did not significantly affect viral replication, as shown using the pseudotype virus.

References Peters *et al.* 2008a
- Gag sequences from 468 HIV-1 positive sex workers from the Kenyan Pumwani cohort were analyzed to bioinformatically identify positively selected residues that could be related to antigen processing. Mutation effects on disease progression were followed by mean CD4 counts. This method is also one way of identifying potential CTL epitopes and classifying them.
- A Gag positive selection map was generated and sites were classified as beneficial or harmful to HIV. They were correlated to antigen processing (proteasomal cleavage), antigen presentation (TAP transport efficiency) and T-cell receptor binding.
- p17 and p24's structural constraints limited their diversity, while p7-p1-p6 showed a higher average entropy.
- HLA-B*5703 correlating mutant A163G of KAF11, KgFSPEVIPMF, is associated with an increased CD4 count. Since the mutant epitope is still presented efficiently, it continues to correlate with slow disease progression.

Epitope KAFSPEVIPMF
Epitope name KF11
Subtype B, C
Immunogen HIV-1 infection

Species (MHC) human (B*57)
Country Canada, South Africa
Keywords escape
References Carlson *et al.* 2008

- A statistical model, the phylogenetic dependency network (PDN), was developed to differentiate the confounding effects of codon variation, linkage disequilibrium of HLA alleles and HIV phylogeny from HLA-associated evolution including HIV selection by HLA-pressure and codon evolution.
- This approach was applied to 2 cohorts of 1144 Gag sequences from HIV-infected individuals, generating associations between HIV codons themselves and codons with HLA alleles. Results generated predicted escapes that confirmed that escape kinetics and compensating mutations are consistent across clades. General patterns of covariation and CTL adaptation were determined. Some clade-based differences were identified.
- HLA-B*57-restricted KAFSPEVIPMF escape, A163G i.e. KgFSPEVIPMF is predicted by escape substitutions in other epitopes, viz. T242N in TW10, I147M in IW9 and lack of escape at 310 in QW9.

Epitope `KAFSPEVIPMF`
Epitope name KF11
Subtype ACD
Immunogen HIV-1 infection
Species (MHC) human (B*57)
Country Australia, Canada, Germany, United States
Keywords HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- Escape (and reversion) rates for B*57-restricted epitopes were highest for Gag-TW10 (TSTLQEQIGW) > RT-IW9 (IVLPEKDSW) > Nef-YY9 (YTPGPGIRY) > Nef-HW9 (HTQGYFPDW) > Gag-IW9 (ISPRTLNAW) > Gag-KF11 (KAFSPEVIPMF) .
- HLA-B*57-associated substitution within optimally defined epitope KAFSPEVIPMF is at position A2, KaFSPEVIPMF. Despite >40% frequency of recognition in acute infection, KF11 exhibited no HLA-driven sequence evolution.

Epitope `KAFSPEVIPMF`
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B*5701)
Keywords rate of progression, immunodominance
References Migueles & Connors 2001

- HLA B*5701 was found in a very high frequency in HIV-1 infected non-progressors, 11/13 (85%) versus 19/200 (9.5%) of progressors. Non-progressors tended to have an immune response that was highly focused on four p24 epitopes that were presented by B*5701, ISPRTLNAW, KAFSPEVIPMF, TSTLQEQIGW, and QASQEVKNW.
- Attempts to make all for HLA B*5701-epitope tetramers were made, but only the HLA B*5701-KAFSPEVIPMF tetramer folded properly. The percentage of CD8+ T cells staining with this HLA B*57 gag tetramer and the fraction of CD69+IFN-+

CTL CD8+

cells responding to autologous B cells pulsed with KAFSPEVIPMF was highly correlated (r = 0.84; P = 0.005). The percent of CD8+ T cells that stain with the A*2 gag SLYNTVATL tetramer was low (0-0.31%) in a A2+ B57+ LTNP, emphasizing the focus of the immune response on the B*5701 epitopes.

Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding, Flow cytometric T-cell cytokine assay
Keywords rate of progression, TCR usage, variant cross-recognition or cross-neutralization
References Turnbull *et al.* 2006

- Functional cross-reactivity of CD8 responses to HIV-1 epitopes restricted by different HLA-alleles was analyzed. It was shown that epitope-specific responses with the most efficient cross-recognition were strongly associated with delayed disease progression. Variant-cross recognition efficiency was linked to the dominant TCRs used for epitope recognition. Epitopes restricted by the same HLA-allele did not show similar variant cross-recognition efficiency, suggesting that the rate of disease progression might be associated with the quality of responses to certain critical epitopes.

- This epitope, B57-KAF that is strongly associated with delayed progression to AIDS and its natural as well as alanine-substituted variants are efficiently cross-recognized. At lower peptide concentrations, efficiency of variant cross-recognition was reduced, even while interepitopic differences in variant cross-recognition efficiency were maintained. CTLs responding to this epitope expressed the same predominant TCR Vbeta family, but individuals whose CTLs predominantly used TCR Vbeta 17 had less efficient variant cross-reactivity.

References Yu *et al.* 2007a

- To study the contributions of HLA alleles and TCRs to the prevention of viral escape, HLAs B*5701 and B*5703 that differ at only 2 residues were followed with epitope KF11 and variants. B*5701-KF11 allowed fewer viral mutations along with a narrow TCR repertoire while B*5703-KF11 had a greater repertoire of TCR but also greater numbers of escape mutations. Therefore extensive TCR diversity is not a prerequisite to the prevention of viral mutations. More heterogeneous TCR-beta chains were also seen in the HLA-B*5703-KF11 situation and greater numbers of KF11 variants arose especially in clade C-infected subjects.

CTL CD8+

- For both Clades B and C HIV-1, this epitope KAFSPEVIPMF (wt) i.e. KF11 spawned variants KgFSPEVIPMF (A2G), KnFSPEVIPMF (A2N), KsFSPEVIPMF (A2S), KsFnPEVIPMF (A2S-S4N) and KsFSPEiIPMF (A2S-V7I). In addition, Clade C also allowed variants KgFnPEVIPMF (A2G-S4(N/K)) and KgFkPEVIPMF (A2G-S4(N/K). Overall, HLA-B*5703 subjects showed more of these sequence variants than HLA-B*5701 possessing subjects did.

- To study whether CTL responses restricted by "good" HLA I molecules exert stronger immune selection than other HLA I molecules, 54 and 70 optimal epitopes within HIV-1 Gag, Pol and Nef genes for Caucasian and African cohorts were tested in patients over a mean of 14 months. "Good", advantageous HLA allele-restricted epitopes were much more polymorphic than epitopes restricted by other, non-advantageous HLA in patients, suggesting that benefits associated with HLA Class I alleles of elite controllers of disease progression are epitope-specific. Such "driver" epitopes with high polymorphism had high frequency of immune response, allowing them to be ranked for recognition and polymorphism.
- Patients with higher proportions of mutated epitopes also had lower plasma viral loads, and mean epitope variability correlated negatively with relative hazard of disease progression.
- This Gag epitope KF11 is highly variant in the African cohort when restricted by B*5703, but is conserved in the Caucasian B*5701-positive cohort.

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with preseroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-B57+ individuals that had a CTL response to this epitope broken down by group: 0/0 group 1, 0/0 group 2, and 2/2 group 3.

Epitope KAFSPEVIPMF
Immunogen HIV-1 infection
Species (MHC) human (B57)
References Appay *et al.* 2000

- Combined tetramer and intracellular cytokine staining was used to study the function of circulating CD8+ T cells specific for HIV and CMV.
- HIV-specific CD8+ T cells expressed lower levels of perforin than CMV-specific CD8+ T cells from the same donor, and this was associated with persistent CD27 expression on HIV-specific cells, suggesting impaired maturation.
- In most donors, between 50% and 95% of the activated virus-specific CD8+ T cells produced IFN-γ and MIP-1β with a distinct subset that failed to produce TNF-α.

Assay type CD8 T-cell Elispot - IFNγ
Keywords acute/early infection, early-expressed proteins
References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.

- All HIV-1 proteins except Vpu were recognized, and responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- Alleles A3, B35, B57, and B62 were more frequently recognized than alleles A1, A2, A30, and A44 e.g., during primary infection. 2/10 patients, 1372 and 1397, recognized A2-restricted epitopes. The common A2-restricted epitopes Gag SL9 and Pol IV9 were not recognized in peptide tetramer-binding assays.

Assay type Cytokine production, Tetramer binding, Intracellular cytokine staining, Degranulation, CD107a and b cell surface mobilization
Keywords TCR usage
References Betts *et al.* 2004

- Both cytokine production and degranulation in HIV-1 specific and CMV specific CD8+ T -cells occurs at high peptide concentrations together with TCR downregulation. Only degranulation is observed at lower peptide concentrations with no observed TCR downregulation. Thus the nature of CTL response depends not on the specific T cell clonotype or antigen, but on the concentration of Ag presented on APCs.

Assay type CD8 T-cell Elispot - IFNγ
Keywords variant cross-recognition or cross-neutralization
References Draenert *et al.* 2004c

- CD8+ T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2-39) epitopic regions were targeted in an average of 6 proteins (range, 1-8). HAART resulted in decrease in antigen and reduction in gamma IFN EliSpot responses, suggesting active responses to autologous virus. The lack of mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN-based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- 2 subjects recognized this epitope, 1 with high functional avidity, 1 with intermediate. Autologous sequence revealed no substitutions in this epitope compared to the B consensus.

References Jansen *et al.* 2005

- HLA-B57 has been associated with long term non-progression in HIV+ people. The number and responsiveness of CD8 T-cells directed to different Gag peptides presented by HLA-A2, -B8 and B57 were compared. T cells specific for the HLA-B57 epitope KAFSPEVIPMF responded to a higher extent and more readily to antigenic stimulation than those specific for the A2 epitope SLYNTVATL and the B8 epitope EIYKRWII.
- Tetramer decay experiments indicate that the HLA-B57 peptide has a higher half-life than the A2 and B8 peptides. The authors point out that CD8+ T cells with high binding affinity may require less help.
- Variant forms of the HLA-B57 epitope KAFSPEVIPMF were found in the 3/5 HLA B57+ individuals sequenced, but the variants were always a minor form.

Assay type CD8 T-cell Elispot - IFNγ
Keywords binding affinity, subtype comparisons, acute/early infection
References Malhotra *et al.* 2007b

- T-cell responses to clade B Gag peptides were tested using sequences based on consensus (CON), most recent common ancestor (ANC) and center of tree (COT); as well as CON sequences from clade A, clade C and M-group Gag. It was found that Gag-specific cross-clade T-cell IFN-gamma responses are detectable during primary infection, and there was no significant difference in breadth or magnitude of responses with the different peptide sets. While several epitopes in low diversity domains are invariant across clades, other recognized variants are seen outside HLA anchor positions. T-cell immunity often tolerates conservative or semi-conservative amino acid substitutions but changes presumed to be in TCR contact sites may abrogate epitope recognition.
- This epitope, KAFSPEVIPMF, is invariant across CON A, B, C and M-Group sequences, as well as clade B COT and ANC sequences. HLA-B57 restriction was inferred based on subject possessing appropriate HLA class I allele and prior publication

References Streeck *et al.* 2007a

- To characterize HIV-1 proteome areas that are targeted in early, effective CTL responses, two cohorts were studied. Responses in early infection were against fewer epitopes and of lower magnitude than during chronic infection. While no region of the proteome was favored, Nef was the predominant target based on length of proteins.
- When based on the expression of protective versus nonprotective HLA I alleles, it was found that HLA-B27 and -57 possessing slow progressors to disease directed the majority of their responses to Gag in early infection, as opposed to those with HLA-B*3501 or B*3502, i.e. rapid progressors to AIDS, who had negligible responses to Gag. As compared with HLA-B57-/B27- subjects and HLA-B35 subjects, HLA-B57+/27+ subjects responded most to the p24 component of Gag. By using overlapping peptides within Gag p24, two were picked as being consistently targeted, and both contained previously described epitopes TSTLQEQIGW and KRWIILGLNK.
- IVLPEKDSW, i.e. epitope IW9 of RT protein was targeted in 62% of B57+ non-progressors to disease.

Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding
Keywords memory cells
References Wherry *et al.* 2006

- Cohorts of HIV-infected subjects from the US and South Africa were screened for CD8+ EliSpot responses. Tetramer assays were performed for 13 frequently targeted HIV epitopes and compared to Flu, vaccinia, and EBV epitopes assayed in non-HIV-infected subjects. HIV tetramer+ CD8 T cells expressed less CD127, and this reduction was pervasive across all epitopes and alleles tested. These results indicated impaired HIV-specific memory CD8 T cell differentiation, regardless of level of control of viremia, epitopes targeted, or HLA alleles.

Keywords responses in children, mother-to-infant transmission, escape, characterizing CD8+ T cells
References Feeney *et al.* 2005

- Escape mutations in TW10 and other B57-restricted epitopes were shown to arise early in infants following perinatal infection. Some escape variants were likely to have been transmitted vertically, from HLA-B57/5801 positive HIV-1 infected mothers, while others arose during infancy in cases where the children inherited the B57/5801 allele paternally. In contrast to adults, the majority of children showed a robust response to the escape variants, suggesting that infants are able to mount functional immune responses and drive immune escape and that a developing immune system may exhibit greater plasticity in recognizing viral variants.
- KAFSPEVIPMF was frequently recognized in children and in adults.

Donor MHC A2, A36, B45, B58, Cw3, Cw6
Country Nigeria
Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons
References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype G Gag. The autologous epitope sequence in this person matched the known epitope.

Immunogen HIV-1 infection
Species (MHC) human

Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining, Other
Keywords binding affinity, acute/early infection
References Lichterfeld *et al.* 2007b

- Differences in early versus chronic AIDS include a decline in CTL number accompanied by a reducing viremia. Comparative analysis of such CTLs in this study show that early infection is characterized by a different clonotypic composition and higher functional avidity of CTLs followed by their selective depletion during transition to chronic disease. The total magnitude of CTL cytokine production is lower in early infection. Intraindividual, early CTLs' functional avidity for the same epitope decreases concomitantly with a reduction in clonotypic TCR repertoire especially of strongly activated and CD127lo, CD38+, Ki-67hi CTLs while progressing to chronic infection states.
- None of the target epitopes, including this epitope KAFSPEVIPMF seen in 1 patient, underwent sequence changes.

Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided, it appears to be HXB2.
- Responses to this peptide were detected in 22% of the study subjects, and it was one of the 25 most frequently recognized peptides.

References Zhao *et al.* 2007

- 46 ART-naive subjects with HIV-B infection were used to study CTL cross-responses between HIV clade B and C peptide sequences. 204/826 overlapping peptide epitopes tested were common between both clades in eliciting CTL responses that were of similar magnitude and frequency in both HIV-B and -C. Higher magnitudes and frequencies of responses were detected with peptides from Gag, Pol, Env and Nef proteins, while peptides from Rev, Vif, Vpu, Vpr and Tat were recognized less often.
- 27 peptides from immunodominant regions of higher interclade homology in Gag, Nef, Pol, Vpr, Env and Vif were found to be common between both clades in eliciting the greatest CTL responses. Although these 27 peptides differed by up to 39% between clades, CTL responsiveness was not affected.
- Cross-recognized peptides had a lower entropy of recognition than clade-B specific variants, suggesting that published conserved clade-B sequences are also more conserved between clades. Consensus sequences therefore occurred in virus regions of low intra-clade entropy and high inter-clade homology.
- 18/27 highly immunogenic clusters were previously reported by Frahm et al. [J. Virol. 78:2187-2200 (2004)].
- This peptide, sqVSQNYPIVQNLQGQMV differs from the consensus C sequence kVSQNYPIVQNLQGQMV at 2 amino acid positions, i.e. by 11.1%.

Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords binding affinity, immunodominance
References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, AFSPEVIPMFSALSEGA, had an overall frequency of recognition of 15.3% - 16.9% AA, 11.5% C, 18.2% H, 9.5% WI. This peptide is included in a 49 aa Gag-p24 highly reactive region to be used for vaccine design. It is also part of 'Region III', PRTLNAWVKVVEEKAFSPEVIPMFSALSEGA, a 31 aa region recognized by >90% of subjects across ethnic groups.

References Frahm *et al.* 2005

- HLA-B63-positive subjects were shown to be able to generate CTL responses early in acute HIV infection and to control HIV replication in the absence of antiretroviral treatment. Since HLA-B63 shares the epitope binding motif of HLA-B57 and -B58, it was shown that HLA-B63-positive individuals mounted CTL responses to previously identified B57-restricted epitopes, as well as novel, B63-restricted epitopes. Moreover, these novel B63-restricted epitopes can also be presented by HLA-B57 and -B58.
- This is a putative HLA-B63/57/58 epitope containing the B58 supertype binding motif. Significantly more often recognized by B63+ and B57/58+ subjects than by negative subjects. Optimal epitope defined.

Assay type CD8 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords vaccine-induced epitopes, characterizing CD8+ T cells
References Horton *et al.* 2006a

- CD8+ T-cell function induced by HIV-1 immunogens and natural infection was compared. Natural infections consisted of early, chronic, and long term nonprogressors.
- B27- and B57-restricted CD8+ T cells from nonprogressors exhibited greater expansion than those restricted by other alleles, providing an explanation for the observed association between HLA-B27/B57 and control of HIV-1 infection.

Epitope EVIPMFSAL
Epitope name EL9(p24)
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A26)
Country China
Assay type CD8 T-cell Elispot - IFNγ
References Zhai *et al.* 2008

- 49 ART-naive chronically HIV-1 infected Chinese subjects' CTLs were tested with 413 OLPs in IFN-gamma assays, determining optimal epitopes specific for Chinese Clade B HIV-1 sequences.
- An inverse correlation was found between CTL response and viral load.
- Targeted peptides have lower entropy than peptides that are not CTL targeted. This correlation is independent of HLA-restriction.
- Previously described HLA-A26-restricted epitope EVIPMFSAL elicited an immune response in Chinese HIV-1 positive subjects as part of peptide AFSPEVIPMFSALSEGA.
- 5 of the 8 HLA-A26 carriers responded to EVIPMFSAL-containing peptide with average magnitude of CTL response of 646 SFC/million PBMC (author communication and Fig.1).

Country United States
Assay type Cytokine production, Flow cytometric T-cell cytokine assay, Degranulation, CD107a and b cell surface mobilization
Keywords supervised treatment interruptions (STI), immunodominance, characterizing CD8+ T cells, drug resistance
References Daucher *et al.* 2008

- A detailed analysis of 6 chronically infected patients' CTL responses to autologous virus was performed after ART and SIT (structured interruption of therapy). Qualitative responses including degranulation and production of IFN-gamma, MIP-1beta, TNF-alpha, IL-2, but not memory CD27, CD45RO and CD57 T cells correlated with extended low plasma viremia. Frequency and breadth of CTL response as well as immune escape did not influence virological outcome.
- One patient exhibited drug resistance mutations K170R (to NNRTI efavirenz) and D76N, K70R (to NRTIs).
- Data confirmed that autologous epitopes were preferentially recognized over optimal, consensus sequences.
- Patients with favorable virological outcomes demonstrated CTL recognition within multiple, conserved regions of Gag and Nef.
- Patients with poor virological outcomes recognized optimal epitopes with much lower frequencies, though this was not significant.
- HLA-Cw3-restricted epitope, EVIPMFSAL, elicited a response in 1 patient and is found in Gag immunodominant region EKAFSPEVIPMFSAL.

Epitope EVIPMFSALSEGATP
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Assay type T-cell Elispot
Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.

- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Species (MHC) human (Cw*01)
Country United States
Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay
Keywords binding affinity, immunodominance
References Cao *et al.* 2008

- For the first time, viral immune evasion is reported via an insertion mutation, in an ART-naive patient. A 3 aa repeat, SPT inserted within p6<sup>Pol<sup> epitope NL8 is reported. This insertion is associated often with ART drug resistance to NRTI drugs. Thus immune pressure and drug resistance may cause HIV-1 to select the same variation.
- A concomitant insertion mutation APP, is seen in p6<sup>Gag<sup>, permitting viral budding.
- Epitope VIPMFSAL elicited an early, dominant response in subject PIC1362. Epitope VL8 bound its MHC I less strongly than NL8, NSPTRREL, did its MHC I molecule.

Assay type CD8 T-cell Elispot - IFNγ
Keywords escape, immune evasion, optimal epitope
References Liu *et al.* 2006b

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.

Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons, immunodominance
References Zhao *et al.* 2007

- 46 ART-naive subjects with HIV-B infection were used to study CTL cross-responses between HIV clade B and C peptide sequences. 204/826 overlapping peptide epitopes tested were common between both clades in eliciting CTL responses that were of similar magnitude and frequency in both HIV-B and -C. Higher magnitudes and frequencies of responses were detected with peptides from Gag, Pol, Env and Nef proteins, while peptides from Rev, Vif, Vpu, Vpr and Tat were recognized less often.
- 27 peptides from immunodominant regions of higher interclade homology in Gag, Nef, Pol, Vpr, Env and Vif were found to be common between both clades in eliciting the greatest CTL responses. Although these 27 peptides differed by up to 39% between clades, CTL responsiveness was not affected.
- Cross-recognized peptides had a lower entropy of recognition than clade-B specific variants, suggesting that published conserved clade-B sequences are also more conserved between clades. Consensus sequences therefore occurred in virus regions of low intra-clade entropy and high inter-clade homology.
- 18/27 highly immunogenic clusters were previously reported by Frahm et al. [J. Virol. 78:2187-2200 (2004)].
- This peptide, PMFsALSEGATPQDLNTM differs from the consensus C sequence PMFtALSEGATPQDLNTM at 1 amino acid position, i.e. by 5.6%.

References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, PMFSALSEGATPQDLNTM, had an overall frequency of recognition of 16% - 20.3% AA, 15.4% C, 13.6% H, 4.8% WI. This peptide is included in a 49 aa Gag-p24 highly reactive region to be used for vaccine design. It is also part of 'Region III', PRTLNAWVKVVEEKAFSPEVIPMFSALSEGA, a 31 aa region recognized by >90% of subjects across ethnic groups.

Keywords dynamics, immunodominance, escape, kinetics, characterizing CD8+ T cells, viral fitness and reversion
References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape,within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- There was a weak response to this epitope during acute and early infection, and the epitope sequence did not vary during the first year of the infection.

References Cao *et al.* 2000

- HIV-1 subtypes A and D dominate the Ugandan epidemic, and a vaccine trial using B clade antigen is underway – this study addresses relative levels of cross-reactive CTL responses in Ugandans to A, D, and B clade recombinant vaccinia viruses expressing Gag, Env, Pol, RT or Nef from HIV-1 clades A, B, and D.
- Proteins corresponding to the subtype of the infecting strains tended to trigger higher levels of CTL response measured by percent specific lysis, but there was extensive inter-subtype cross-reactivity with B clade proteins and the co-circulating subtype.
- This optimal epitope sequence, recognized by CTL derived from a Ugandan with an A subtype infection (patient SP 511), is cross-reactive with subtypes A, B and D peptides.

Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, early-expressed proteins
References Altfeld *et al.* 2006

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

References Montefiori *et al.* 2003

- HIV-1 + patient AC10 underwent early HAART treatment, which was discontinued 1.5 years later. At this timepoint potent NAb responses against autologous virus were detected. Treatment interruption initially induced weak CD8+ responses directed against 5 epitopes. By days 873d and 923d the CTL response had broadened to target 22 epitopes; of these six were fully characterized. Eventually the virus escaped the NAb response, but escape was not accompanied by a rise in viral load, and the authors suggest the virus was contained by the CTL response.

- Killing efficiency of CTLs and their ability to suppress viral replication is shown to depend more on epitope specificity than to antigenic avidity. Different clones recognizing the same epitope had similar killing efficiency despite their variation in avidity. Nef specific CTL clones tended to be most inhibitory, followed by Gag, then by RT specific clones, regardless of avidity.
- 1/14 CTL T-cell clones tested were specific for Gag/p24-SL9. Under conditions of excess peptide (100ug/ml), there was no difference in their lytic potential; all possessed similar effector capacity. Avidity was measured as the sensitizing dose of peptide required for 50% of maximal killing (SD50), which varied from 20 pg/ml to 100 ng/ml, over four orders of magnitude for all 14 epitopes. The SD50 value for Gag/p24-SL9 was 30 pg/ml, it was among the peptides with the highest avidity.

References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, GATPQDLNTMLNTVGGH, had an overall frequency of recognition of 20% - 18.6% AA, 11.5% C, 18.2% H, 4.8% WI. This peptide is included in a 49 aa Gag-p24 highly reactive region to be used for vaccine design. It is also part of 'Region III', PRTLNAWVKVVEEKAFSPEVIPMFSALSEGA, a 31 aa region recognized by >90% of subjects across ethnic groups.

Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords rate of progression, immunodominance
References Geldmacher *et al.* 2007b

- The objectives of this study were to find antiviral epitopic determinants of Gag HIV-specific CTL response and to find 'host HLA-CTL response' correlations. By studying 56 ART-naive subjects including low viral load (LVL) responders, the authors show that subjects expressing the "protective" HLA-B*0702, -B*5801, and -B*8101 have broader Gag epitope recognition which may be abrogated if co-expressed with HLA-B alleles associated with rapid AIDS progression. Also, a negative linear relation was seen between Gag epitope numbers and plasma viral load while a positive relationship was seen with CD4 T-cell count. Finally, LVL subjects recognized specific Gag regions at the N- and C-termini of the protein more often than peptides in the middle of the protein.
- The epitope TPQDLNTML elicits a strong CTL-response and was targeted with high magnitude by 41% of the subjects. TL9 is highly conserved in subtype C and shows no evidence of viral escape by point mutations. This immunodominant response did not have a role in viral control, as subjects with B*8101 who do target TL9 have high viral loads. TL9 is presented by HLA Class I alleles B*0702, B*4201 and B*8101.

Epitope TPQDLNTML
Epitope name TL9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B*42, Cw*08)
Country Australia, Canada, Germany, United States
Keywords HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-B*42 and Cw*08-associated substitution within optimally defined epitope TPQDLNTML is at position Q3, TPqDLNTML and at position T7, TPQDLNtML respectively.

Keywords binding affinity
References Gillespie *et al.* 2007

- MHC can exert a protective effect on HIV-1 disease progression by the interaction of MHC Class I molecules with Killer Inhibitory Receptors (KIR) of the innate immune system. Here, KIR3DS1, a putative stimulatory receptor and allele of the inhibitory KIR3DL1, is studied. Bw4 MHC Class I proteins were implicated in this KIR's ligand specificity, but the authors were unable to generate binding of Bw4Ile80 tetramers in complex with epitopes to KIR3DS1 transiently expressed on 293-T cells, using a panel of HIV-epitopes differing at p7 and p8.
- This epitope, TPQDLNMML (MHC Class I restriction, serotype Bw4Ile80) complexed with MHC B*5301 as a tetramer was unable to bind KIR3DS1 at 4, 20 and 37C.

Keywords HLA associated polymorphism
References Rousseau *et al.* 2008

- 3 phylogenetic correction methods—MLL (maximum likelihood character state analysis followed by likelihood ratio test), MLF (maximum likelihood character state analysis followed by Fisher test), and parsimony character state analysis were used to identify points in the HIV-1 subtype C proteome that conferred susceptibility or resistance to CTLs. Associations of HLA-epitope combinations that were inferred to be susceptible or resistant were organized into immunological sets. While all proteins were interrogated, Gag, Pol, Env and Nef were focused upon. Amino acid changes were evaluated for association with plasma viral load.
- Proteome maps may be seen at `http://www.hiv.lanl.gov/content/immunology/hlatem/study5/index.html` with information showing single or multiple sites involving escape and reversion.
- HLA- B and -C alleles associated more with aa changes than HLA-A, suggesting that the former two are more important in driving viral evolution.
- The ratio of susceptible to resistant residues in HIV proteins was in descending order, Vpr>Gag>Rev>Pol>Nef>Vif>Tat>Env>Vpu, showing that epitopes from the earlier proteins are more conserved owing to viral fitness cost upon mutation.
- This previously described Gag p24 HLA B*81-restricted epitope, TPQDLNTML was susceptible at L5. Variants TPQDmNTML, TPQDyNTML, TPQDsNTML were resistant to CTL response, but associated with lower viral loads. This epitope is 1 of 7 that suggest a fitness cost to immune escape.

- To study whether CTL responses restricted by "good" HLA I molecules exert stronger immune selection than other HLA I molecules, 54 and 70 optimal epitopes within HIV-1 Gag, Pol and Nef genes for Caucasian and African cohorts were tested in patients over a mean of 14 months. "Good", advantageous HLA allele-restricted epitopes were much more polymorphic than epitopes restricted by other, non-advantageous HLA in patients, suggesting that benefits associated with HLA Class I alleles of elite controllers of disease progression are epitope-specific. Such "driver" epitopes with high polymorphism had high frequency of immune response, allowing them to be ranked for recognition and polymorphism.
- Patients with higher proportions of mutated epitopes also had lower plasma viral loads, and mean epitope variability correlated negatively with relative hazard of disease progression.
- Variants TPsDLNTML and TPQDLNsML at positions 3 and 7 were the predominant polymorphisms found.

Assay type CD8 T-cell Elispot - IFNγ
Keywords supertype, cross-presentation by different HLA
References Frahm *et al.* 2007b

- 100 HIV-infected subjects were tested for response to optimally-defined CTL epitopes regardless of the subject's HLA type. Half of all detected responses were seen in the absence of the originally reported restricting HLA class I allele, and only 3% of epitopes were recognized exclusively in the presence of their original allele. Statistical and experimental methods were used to define additional HLA alleles associated with the epitopes.
- Based on a prediction of the minimum number of HLA alleles needed to cover the HLA representation in all responders to this epitope, a minimum set of 6 alleles was found: 4 alleles previously known to be associated (B07, B42, B53, B81) and 3 additional alleles (A02, A24, B14).

References Geldmacher *et al.* 2007a

- 56 ART-naive subjects were studied to assess whether T-cell responses to Gag and Nef are biased towards infecting subtype recognition, in a setting of epidemic consisting of subtypes A,C and D and their recombinant forms. The infecting subtype was determined by multi-region hybridization assay. Overlapping 15-mer isolate-based Gag and Nef peptide sets representative of local subtypes were used. The best recognized epitope variant in terms of magnitude and breadth corresponded to infecting subtype, in this case usually type-C. Hot spots of CTL recognition in Gag were in p24, p17 and p15; hotspots against Nef were in its central, conserved region.
- Epitope variants TPQDLNtML and TPQDLNmML were studied as peptide sequences EGATPQDLNtMLNTV (subtypes C and D) and EGATPQDLNmMLNIV (subtype A), with >40% responders altogether. Subtypes C and D sequence was recognized best. Associated HLAs frequently expressed within the studied cohort are listed in the study as B07, B42 and B81.

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

References Dorrell *et al.* 2001

- In clade A infected Gambians, three HLA-B53 epitopes were defined in Gag p24 using ELISPOT, tetramer, and cytotoxicity assays.
- This optimal epitope was identified within the 20 mer reactive peptide that carried it by homology with a B53 epitope from HIV-2, a B subtype B7 peptide that corresponds to it, as B53 is part of the B7 superfamily, and by the proline in the anchor at position 2.
- TPQDLNMML was recognized in 6/7 HLA-B53 subjects and was immunodominant in most subjects.
- TPQDLNMML was A subtype-specific with no cross-recognition of the subtype B, C, and D variant, TPQDLNTML, although the B/C/D variant bound more efficiently to B53 – position 7 show great positional variation in crystal structures of two HLA-B53 complexes, suggesting variation here might significantly alter the position of the peptide in the binding groove and thus affect TCR interactions.
- Only one subject might have had a cross-reactive response with the HIV-2 and Mamu-A*01 variant CTPYDINQML, and this subject might have been dual infected with HIV-2.

Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding, Flow cytometric T-cell cytokine assay
Keywords characterizing CD8+ T cells, HIV-2
References Gillespie *et al.* 2005

- CD8 T-cell responses were evaluated and compared in HIV-1 and HIV-2 infected individuals living in the Gambia. A significantly greater magnitude and breadth of Gag-specific responses were found in HIV-1 infected individuals, possibly because of low or undetectable viral loads in HIV-2 infected individuals. This finding suggests that responses in HIV-2 infection reflect antigen load in plasma, as is the case in HIV-1 infection. No correlation was found between immune control of HIV-2 and the frequency of perforin-expressing virus-specific CD8 T-cells.
- 5/7 HIV-1-infected B53-positive subjects recognized TPQDLNMML, the HIV-1 version of this epitope. 3/3 HIV-2-infected B53-positive subjects responded to TPYDINQML, the HIV-2 version of the epitope.

Country Belgium, Senegal
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords subtype comparisons, HIV-2
References Jennes *et al.* 2008

- To compare HIV-1 and HIV-2 CTL responses to Gag as far as homologous levels of response and cross-reactivity, 12 consecutive Gag OLP pools were used with cells from 17 HIV-1 and 17 HIV-2 patients in enhanced IFN-gamma ELISpot assays. Gag-specific homologous CTL responses were significantly higher in HIV-2 patients, but cross-reactivity in HIV-1-infected patients was broader and stronger.
- Cross-reactivity correlated with sequence similarity in HIV-2 patients, but not HIV-1 patients. CD4+ T-cell counts of HIV-2-infected patients correlated directly with homologous responses and inversely with cross-reactive responses; this was not true of HIV-1-infected subjects.
- The authors favor a model in which high HIV-2-specific CTL responses control its replication, containing immune evasion and thus limiting the possibility of cross-reaction to HIV-1 homologous epitopes.
- HIV-2 Gag epitope TPYDINQML is not cross-recognized with its homologous HIV-1 epitope, TPQDLNMML.

Keywords HAART, ART, supervised treatment interruptions (STI)
References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (`http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html`) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8+ T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient A displayed the greatest response to epitope B14-EL9(gp41), a strong response to B7-TL9(p24), and responses to B7-TM9(Nef) and A32-PW10(RT).

Species (MHC) human (B81)
Country United States, South Africa
Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding
Keywords memory cells
References Wherry *et al.* 2006

- Cohorts of HIV-infected subjects from the US and South Africa were screened for CD8+ EliSpot responses. Tetramer assays were performed for 13 frequently targeted HIV epitopes and compared to Flu, vaccinia, and EBV epitopes assayed in non-HIV-infected subjects. HIV tetramer+ CD8 T cells expressed less CD127, and this reduction was pervasive across all epitopes and alleles tested. These results indicated impaired HIV-specific memory CD8 T cell differentiation, regardless of level of control of viremia, epitopes targeted, or HLA alleles.

Epitope `TPQDLNTML`
Immunogen HIV-1 infection
Species (MHC) human
Assay type CD8 T-cell Elispot - IFNγ
Keywords assay standardization/improvement, epitope processing, characterizing CD8+ T cells
References Beattie *et al.* 2004

- This study compared CD8+ T-cell EliSpot reponses to 58 Gag peptides that were optimal epitopes, with responses to overlapping 15 mers that spanned Gag. When screening for HIV-1-specific CD8+ T-cell responses from 49 HIV+ people, overlapping 15-mer peptide pools revealed several novel responses that would have been missed using predefined CD8 epitopes. However, the 15-mer pools often missed low-level responses to predefined epitopes, especially when the epitope was located centrally in the 15-mer peptide, and the overall level of response to the 15 mers was generally lower(mean 1.4 five fold dilutions lower, range 0-3).
- The response to TPQDLNTML was used as an example of a titration curve. When comparing the peptide TPQDLNTML to the 15 mer EGATPQDLNTMLNTV, the 15 mer had a diminished response to the same amount of peptide.

Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding, Other
Keywords supertype, escape, cross-presentation by different HLA, TCR usage, HLA associated polymorphism
References Leslie *et al.* 2006

- 14 promiscuous HIV-specific CTL epitopes presented by B7 supertype alleles were described. It was shown that CTLs targeting an identical epitope that are restricted by closely related but different HLA alelles differ in several ways: by occurrence of distinct HLA-specific escape mutations, by recruitment of distinct TCRs by peptide/MHC complexes, and by functional avidity of CTLs. Since there were no differences in the frequency, magnitude or immunodominance of the CTL responses restricted by different HLA alleles, it is suggested that the unique peptide/MHC complexes generated by closely related HLA induce qualitatively different CTL responses.
- Functional avidity was correlated with selection pressure observed in HLA allele-epitope restriction.
- TL9 selection pressure was evidenced by studying changing epitope variants associated with HLAs of the B7 supertype.
- Higher level of polymorphism variation, escape mutations and TCR diversity was associated with the B*8101 allele.
- Statistically significant associations between numbers of HLA-B8101 and -B4201 expressing subjects and epitope TPQDLNTML were found.
- In 3 B-supertype alleles studied, B*4201, B*8101 and B*3910, the TL9 variant at the seventh position, TPQDLNsML, was most common. Several more variants are listed in the paper.

Subtype B, G

CTL CD8+

Immunogen HIV-1 infection
Species (MHC) human (B58)
Donor MHC A2, A36, B45, B58, Cw3, Cw6
Country Nigeria
Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons, variant cross-recognition or cross-neutralization
References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype G Gag. The autologous epitope sequence in this person differed from the known epitope in one position, Q7T, TPQDLNtMLNTV

Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons, variant cross-recognition or cross-neutralization
References Barugahare *et al.* 2005

- T-cell immune responses were examined in HIV-1 infected Ugandans. Similar levels of cross-clade responses for Gag, Env and Nef were observed. Higher frequencies of responses in conserved regions were found for Gag within a single clade, while areas with higher viral sequence variation had fewer detectable responses. Differential interclade sequence homologies between the Gag regions did not affect the respective level of cross-clade recognition.
- This sequence contains a known B7 and B53 epitope, but the subjects recognizing it are B7- and B53-negative. It was conserved in the two people that recognized the peptide.

Assay type CD8 T-cell Elispot - IFNγ, Other
Keywords rate of progression, immune evasion
References Kemal *et al.* 2008

- An LTNP was followed longitudinally over 6 years and 3 sampling time points, until transition to disease. His HLA were heterozygous and not associated with nonprogressive infection, but 3 alleles were associated with poor clinical prognosis. No attenuating mutations in initial samplings, but an insertion in the V2 loop and continuing CCR5 coreceptor use were found.
- A decrease in IFN-gamma response was seen over time, suggesting CTL dysfunction. An increase in T-cell epitopes targeted (e.g. emergence of YL8, YLKDQQLL and WY20, WKFDSRLAFHHMARELHPEY variants and gain of response to EL9, EIKDTKEAL, NL10, NSNPDCKTIL, AK9, AIFQSSMTK, WM8, WSMVRERM, VT15, WVHHTQGYFPDWQNYT) was seen concomitant with disease progression, reflecting viral replication and/or variants.
- HLA-Cw7-restricted autologous epitope PQDLNTMLN failed to generate CTL response. HLA restriction was predicted in this study based on the patient's HLA alleles and previous publication.

Assay type proliferation, CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Dyer *et al.* 2008

- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.
- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- Dissection of Gag-specific responses showed that a broad CTL response was essential to elite control of disease. Immune escape at KRWIILGLNK was not a major cause of disease progression.
- Peptide 46 (NIH ARRP Cat# 7917), PQDLNTMLNTVGGHQ, contains an epitope that is restricted by HLA-A2 in different patients and elicited the following CTL response: (1) >50 sfc/million PBMC for 19+ years in a living non-progressor (2) 22+ years in another living non-progressor.

Epitope DLNTMLNTV
Epitope name G5
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B14)
Keywords HAART, ART
References Mollet *et al.* 2000

- A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFNgamma production to measure responses.
- In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished.
- Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.

HXB2 Location p24 (51–59)
Author Location p24 (183–191)
Epitope DLNMMLNIV
Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (B14)
Keywords HIV exposed persistently seronegative (HEPS), immunodominance
References Kaul *et al.* 2001a

- Variants DLNMMLNIV/DLNTMLNVV are specific for clades A/B.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.

CTL CD8+

- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B14 women, 4/4 HEPS and 3/7 HIV-1 infected women recognized this epitope, likelihood ratio 4.8, p value 0.1, and HEPS women tended to respond to DLNMMLNIV/DLNTMLNVV, while infected women tended to respond to DRF(F/W)KTLRA.
- The dominant response to this HLA allele was to this epitope for all 4/4 HEPS cases and in only one of the 3/7 HIV-1 infected women.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.
- Four epitopes were considered to be "resistant epitopes", as they were preferentially reactive in HEPS women and so may confer resistance, and these were found in three different proteins: A2 ILK(D/E)PVHGV in RT, A*6802 DTVLEDINL in Protease, B14 DLN(M/T)LN(I/V)V in p24 and B18 FRDYVDRF(Y/F)K also in p24.

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Country Australia
Assay type proliferation, CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Dyer *et al.* 2008

- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.
- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- Peptide 49 (NIH ARRP Cat# 7920), GHQAAMQMLKETINE, which contains epitopes restricted by HLA-A2 and -B15 in different patients elicited the following CTL responses: (1) for 22+ years in a living non-progressor (2) for >22 years in a former non-progressor who succumbed to a loss of viremic control.

Keywords vaccine-induced epitopes, Th1, Th2
References Gavioli *et al.* 2008

- It was demonstrated that co-immunization with Tat broadens in vivo epitope-specific CD8 and CD4 responses to heterologous proteins and thus can be considered as an adjuvant. Specifically, mice immunized with Gag and Tat, responded to 11 T cell Gag epitopes, 5 more than those detected in mice vaccinated with Gag alone. Mice immunized with Env and Tat, responded to 17 T cell Env epitopes, 12 more than those detected in mice vaccinated with Env alone.
- Co-immunization with Tat specificaly drove Th1 responses and did not affect Th2 responses.
- Both Th1 and Th2 responses against Tat were no significantly affected by co-immunization with Env.
- This epitope was recognized both by mice co-immunized with Gag and Tat, and by mice immunized with Gag alone.

Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons, immunodominance
References Zhao *et al.* 2007

- 46 ART-naive subjects with HIV-B infection were used to study CTL cross-responses between HIV clade B and C peptide sequences. 204/826 overlapping peptide epitopes tested were common between both clades in eliciting CTL responses that were of similar magnitude and frequency in both HIV-B and -C. Higher magnitudes and frequencies of responses were detected with peptides from Gag, Pol, Env and Nef proteins, while peptides from Rev, Vif, Vpu, Vpr and Tat were recognized less often.
- 27 peptides from immunodominant regions of higher interclade homology in Gag, Nef, Pol, Vpr, Env and Vif were found to be common between both clades in eliciting the greatest CTL responses. Although these 27 peptides differed by up to 39% between clades, CTL responsiveness was not affected.
- Cross-recognized peptides had a lower entropy of recognition than clade-B specific variants, suggesting that published conserved clade-B sequences are also more conserved between clades. Consensus sequences therefore occurred in virus regions of low intra-clade entropy and high inter-clade homology.
- 18/27 highly immunogenic clusters were previously reported by Frahm et al. [J. Virol. 78:2187-2200 (2004)].
- This peptide, GHQAAMQMLKeTINEEAA differs from the consensus C sequence GHQAAMQMLKdTINEEAA at 1 amino acid position, i.e. by 5.6%.

- CTL responses were studied in treated and untreated donors from China, using Gag peptides from Henan isolate. All peptides were predicted to have A2 or A11 restriction (two of the most prominent alleles in Chinese population) and HLA restriction was further analyzed by CTL recognition in patients carrying corresponding allele. Among treated donors, HLA-A2 donors had higher CTL response than than HLA-A11 donors. Chronically infected untreated individuals had higher magnitude of CTL response than treated ones.

Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%)

recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 22% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Subtype B
Immunogen vaccine
Vector/Type: vaccinia, vesicular stomatitis virus (VSV) *Strain:* B clade HXB2, B clade IIIB *HIV component:* Env, Gag
Species (MHC) mouse (H-2K^d)
Keywords immunodominance
References Haglund *et al.* 2002b

- Different HIV strains were used for different regions: Env IIIB, Gag HXB2.
- BALB/c mice were vaccinated with rec vesicular stomatitis virus (rVSV) expressing either HIV-1 Gag or Env, or both, and retention of memory responses and recall responses were studied by tetramer staining and IFN-gamma production.
- Seven months after vaccination with Env-rVSV, 6% of the CD8+ cells were tetramer positive for the immunodominant Env epitope; these cells had a memory phenotype, CD44-Hi positive.
- Env in rec vaccinia virus (Env-rVV) elicited a strong recall response, with up to 45% to the CD8+ T-cell population tetramer positive and activated (expressing CD62L-Lo), and capable of IFN-gamma production.
- A prime with Env-rVSV and heterologous boost of Env-rVV gave remarkably high levels of memory cells, with approximately 1/3 of the CD8+ splenocytes being Env specific memory cells 150 days after the boost.
- A Gag-rVSV or EnvGag-rVSV prime and with a heterologous Gag-rVV or EnvGag-rVV boost combination gave 40% tetramer positive CD8+ cells, but the fraction of IFN-gamma producing cells was only about 25%. Still the heterologous vector prime-boost combination showed a profound benefit.
- A HIV-1 protein rVSV prime, rVV boost was a more potent combination than a vector reversal of a rVV prime and rVSV boost.

References Wild *et al.* 2004

- A codon optimized gag DNA vaccine was compared to a myristylation defective gag and p24 alone, both of which lack signals for secretion from transfected cells. Gag-derived immunogens that were secreted as VLPs and those that remained intracellular (p24) each produced strong CTL responses, and neither the size of antigen nor cellular trafficking and localization significantly influenced the strength of humoral and cellular immune activation. The formation and release of VLPs was not essential for eliciting strong CTL. BALB/c mice were given the DNA vaccine by i.m. administration of plasmid DNA for the prime and boost.
- Linking the region encoding the V3 immunodominant epitope to the gag gene did not diminish the response to the Gag p24 epitope A9I, but did enable a response to the V3 epitope.
- Minigenes were made incorporating just 1 epitope, minitopes, carrying 1 of 3 murine class I eptiopes linked to the Ad2-E3 protein-derived signal peptide to allow access of the epitope to the ER. Weak induction of cellular immune responses was observed, in contrast to the complex polyprotein.

CTL CD8+

References Kwak *et al.* 2004

- A recombinant vaccinia virus with HIV-1 Gag replacing the cytoplasmic domain of the B5R protein was shown to induce better primary CD4 response than recombinant vaccinia virus expressing Gag from the TK-locus; CD8 responses were less specific. When immunized BALB/c mice were challenged with a recombinant Listeria that expresses HIV-Gag, lower colony counts of Listeria were found in the liver and spleen of mice immunized with virus expressing B5R-Gag fusion protein.

References Larke *et al.* 2007

- Cross-clade vaccine recognition was studied using either single-, multi or several anatomically separated single-clade vaccines. Limited cross-clade response was seen with single-clade administrations. Multi-clade vaccines gave immune interference (antagonism and original antigenic sin), reducing CTL response. Simultaneously administered but anatomically separated vaccines from clades A, B, C decreased antagonism and increased immune responses.
- After immunization with Clades A or C vaccines, both containing Epitope G, AMQMLKDTI, T cells responded well to this index epitope, but poorly to Clade B variant AMQMLKeTI, and intermediately to variant AMQiLKDTI. Induction by Clade B vaccine, containing epitope AMQMLKETI, generated good responses to both Clade B and A variants, but not to variant AMQiLKDTI.

References Zhao *et al.* 2007
- 46 ART-naive subjects with HIV-B infection were used to study CTL cross-responses between HIV clade B and C peptide sequences. 204/826 overlapping peptide epitopes tested were common between both clades in eliciting CTL responses that were of similar magnitude and frequency in both HIV-B and -C. Higher magnitudes and frequencies of responses were detected with peptides from Gag, Pol, Env and Nef proteins, while peptides from Rev, Vif, Vpu, Vpr and Tat were recognized less often.

- 27 peptides from immunodominant regions of higher inter-clade homology in Gag, Nef, Pol, Vpr, Env and Vif were found to be common between both clades in eliciting the greatest CTL responses. Although these 27 peptides differed by up to 39% between clades, CTL responsiveness was not affected.
- Cross-recognized peptides had a lower entropy of recognition than clade-B specific variants, suggesting that published conserved clade-B sequences are also more conserved between clades. Consensus sequences therefore occurred in virus regions of low intra-clade entropy and high inter-clade homology.
- 18/27 highly immunogenic clusters were previously reported by Frahm et al. [J. Virol. 78:2187-2200 (2004)].
- This peptide, LKeTINEEAAEWDRLHPV differs from the consensus C sequence LKdTINEEAAEWDRLHPV at 1 amino acid position, i.e. by 5.6%.

- HLA-A11-restricted CTL epitopes in 2 male Han Chinese subjects (one ART naive and one receiving HAART) were determined. A novel epitope was discovered and 5 other putative epitopes confirmed using 425 overlapping peptides spanning the entire HIV-1 clade B proteome. By employing intracellular cytokine staining, the authors developed a new method of mapping optimal epitopes and defining their HLA restriction efficiently. In spite of its being the most common HLA type in China, A*11-restricted epitopes were recognized less frequently than other epitopes, and A*11-restricted responses formed a mean of only 13% of the responses against HIV.
- This epitope, KETINEEAA, was detected within overlapping peptideS GGHQAAMQMLKETINEEA, LKETINEEAAEWDRLHPV and AAEWDRLHPVHAGPIA.

References Bihl *et al.* 2006

- CTL responses were tested for both HIV-1 and EBV derived epitopes restricted by HLA-A, -B and -C alleles. HLA-B alleles more frequently induce detectable responses and that the responses are generally of greater magnitude than those for HLA-A and -C alleles.
- The magnitude and frequency of CTL recognition were related to each other and that TCR avidity for HLA/peptide complexes is a more important determinant for magnitude of response than peptide binding affinity to HLA.
- EBV response patterns were not significantly altered by HIV coinfection.
- Epitope ETINEEAAEW elicited a magnitude of response of 380 SFC with a functional avidity of 0.005nM.

CTL CD8+

Assay type Cytokine production, Flow cytometric T-cell cytokine assay, Degranulation, CD107a and b cell surface mobilization
Keywords supervised treatment interruptions (STI), immunodominance, variant cross-recognition or cross-neutralization, characterizing CD8+ T cells, drug resistance
References Daucher *et al.* 2008

- A detailed analysis of 6 chronically infected patients' CTL responses to autologous virus was performed after ART and SIT (structured interruption of therapy). Qualitative responses including degranulation and production of IFN-gamma, MIP-1beta, TNF-alpha, IL-2, but not memory CD27, CD45RO and CD57 T cells correlated with extended low plasma viremia. Frequency and breadth of CTL response as well as immune escape did not influence virological outcome.
- One patient exhibited drug resistance mutations K170R (to NNRTI efavirenz) and D76N, K70R (to NRTIs).
- Autologous epitopes were preferentially recognized over optimal, consensus sequences.
- Patients with favorable virological outcomes demonstrated CTL recognition within multiple, conserved regions of Gag and Nef.
- Patients with poor virological outcomes recognized optimal epitopes with much lower frequencies, though this was not significant.
- HLA-A25-restricted epitope, ETINEEAAEW, elicited a response in 1 patient with low viremia who also targeted Nef epitopes with high frequency. EW10 is found in Gag immunodominant region LKETINEEAAEWDRVHP. Patient autologous sequence was ETINdEAAEW.

Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (B53)
Keywords HIV exposed persistently seronegative (HEPS)
References Kaul *et al.* 2001a

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B53 women, 0/2 HEPS and 7/9 HIV-1 infected women recognized this epitope.
- The dominant response to this HLA allele was to this epitope in 4 of the 7/9 responsive HIV-1 infected women.

Epitope DTINEEAAEW
Subtype A
Immunogen HIV-1 infection
Species (MHC) human (B53)
Keywords binding affinity, subtype comparisons, epitope processing
References Dorrell *et al.* 2001

- In clade A infected Gambians, three HLA-B53 epitopes were defined in Gag p24 using ELISPOT, tetramer, and cytotoxicity assays.
- Two of the new epitopes lacked the predicted P2 anchors, DTINEEAAEW and QATQEVKNM, and bound to B53 with high affinity, thus extending the anchor residue motif for B53 and the related B35.
- Two overlapping 20 mer peptides carry this complete epitope, but only one stimulates recognition, which could be due to different peptide processing.
- DTINEEAAEW was recognized in only 2/7 HLA-B53 subjects.
- DTINEEAAEW was not A subtype specific and there was cross-recognition although diminished, of the subtype B, C, and D variant, ETINEEAAEW.
- In one of the two subjects there was cross-recognition of the HIV-2 version of the epitope, EIINEEAADW.

Assay type CD8 T-cell Elispot - IFNγ

Keywords subtype comparisons, variant cross-recognition or cross-neutralization
References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described B53 epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype A Gag. The autologous epitope sequence in this person differed from the known epitope by one amino acid, E1D, dTINEEAAEW. It was also recognized in a person carrying a subtype D gag, and in this case the autologous sequence matched the epitope. This was also predicted to possibly be a B58 cross-presented epitope in another subtype D Gag infected person based on peptide reactivity and a known B58 motif.

Assay type CD8 T-cell Elispot - IFNγ
Keywords acute/early infection, variant cross-recognition or cross-neutralization, superinfection
References Yang *et al.* 2005b

- An individual infected with a drug-resistant strain of HIV-1 subtype B with controlled viremia became superinfected with another subtype B strain. The second strain outgrew the first despite lower replication capacity and the same viral phenotype. The strains showed differences in their epitope sequences. The CTL responses to the first strain declined after superinfection, followed by some adaptation of targeting to the new epitopes of the second strain. Differences in the recognized epitopes were suggested to have contributed to the poor immune containment of the second strain.
- The response to the epitope EEAAEWDRV was found in the patient before superinfection and diminished afterwards; the initial infecting and superinfecting strain carried EEAAEWDRl.

Keywords vaccine-induced epitopes, Th1, Th2
References Gavioli *et al.* 2008

- It was demonstrated that co-immunization with Tat broadens in vivo epitope-specific CD8 and CD4 responses to heterologous proteins and thus can be considered as an adjuvant. Specifically, mice immunized with Gag and Tat, responded to 11 T cell Gag epitopes, 5 more than those detected in mice vaccinated with Gag alone. Mice immunized with Env and Tat, responded to 17 T cell Env epitopes, 12 more than those detected in mice vaccinated with Env alone.
- Co-immunization with Tat specificaly drove Th1 responses and did not affect Th2 responses.
- Both Th1 and Th2 responses against Tat were no significantly affected by co-immunization with Env.
- This epitope was recognized both by mice co-immunized with Gag and Tat, and by mice immunized with Gag alone.

Epitope AAEWDRLHPVHAGPIA
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country Barbados, Haiti, United States
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords binding affinity, immunodominance
References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.

- This immunodominant, frequently targeted overlapping peptide, AAEWDRLHPVHAGPIA, had an overall frequency of recognition of 20% - 18.6% AA, 23.1% C, 25% H, 9.5% WI. This peptide is included in a 41 aa Gag-p17 highly reactive region to be used for vaccine design.

Assay type CD8 T-cell Elispot - IFNγ, CD4 T-cell Elispot - IFNγ
Keywords rate of progression, escape
References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses,and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0-80% as efficiently as the index peptide, and the relative efficiency of the variant eptiopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This was one of 8 reactive epitopes found not to vary over time.

- 49 ART-naive chronically HIV-1 infected Chinese subjects' CTLs were tested with 413 OLPs in IFN-gamma assays, determining optimal epitopes specific for Chinese Clade B HIV-1 sequences.
- An inverse correlation was found between CTL response and viral load.
- Targeted peptides have lower entropy than peptides that are not CTL targeted. This correlation is independent of HLA-restriction.
- Previously described HLA-B40-restricted epitope AEWDRVHPV elicited an immune response in Chinese HIV-1 positive subjects as part of peptide AAEWDRVHPVHAGPIA.
- 7 of the 20 HLA-B40 carriers responded to AEWDRVHPV-containing peptide with average magnitude of CTL response of 460 SFC/million PBMC.

HXB2 Location p24 (79–86)
Author Location Gag
Epitope EWDRVHPV
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A2)
Country Sweden
Assay type CD8 T-cell Elispot - IFNγ, Other
Keywords subtype comparisons
References Gudmundsdotter *et al.* 2008

- By studying Gag p24 in different subtypes of subjects, previously discovered and new epitopes were identified. New T cell epitopes, both CD8 and CD4, related to the patients' HLA are described.
- T cells cross-reacted to peptides from different patient subtypes, and this cross-reactivity was distributed along the entire p24 protein.
- HLA-A2-restricted epitope EWDRVHPV is from a subtype B peptide library, and is reactive as part of peptide EWDRVHPVHAGPIA in a subtype B-carrying subject.

HXB2 Location p24 (81–91)
Author Location Gag (213–223)
Epitope DRVHPVHAGPI

CTL CD8+

Epitope name Gag 11.4
Immunogen vaccine
Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* B clade *HIV component:* Env, Gag, Protease, Rev, RT, Tat, Vpu
Species (MHC) macaque
Assay type T-cell Elispot, Intracellular cytokine staining
Keywords subtype comparisons, variant cross-recognition or cross-neutralization, memory cells
References Amara *et al.* 2005

- A clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02_AG consensus Gag in macaques. The activity was better conserved for CD8 than CD4 T cells.
- All 5 CD8 and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation. The similar reported human epitope in this case is VHPVHAGPIA, restricted by HLA B55.
- 3 of 5 CD8 epitopes and 2 of 8 CD4 epitopes were conserved across multiple HIV-1 clades. DRVHPVHAGPI is identical in HXB2 and the CRF02 consensus. It is relatively conserved across other clades, but usually has an L in the third position: DRlHPVHAGPI.

Country Australia
Assay type proliferation, CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Dyer *et al.* 2008

- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.
- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- Peptide 54 (NIH ARRP Cat# 7925), DRVHPVHAGPIAPGQ, which contains epitopes restricted by HLA-B7 in different patients elicited the following CTL responses: (1) 19+ years in a living non-progressor (2) <50 sfc/million PBMC for 19+ years in another living non-progressor.

Assay type CD8 T-cell Elispot - IFNγ, CD4 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, escape
References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses,and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0-80% as efficiently as the index peptide, and the relative efficiency of the variant eptiopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This epitope was not precisely defined, but was one of six epitopes found to be under positive selection for escape mutations and was completely replaced by escape variants between days 66 and 327 (drlhpvhagpIapgqmrepr).

HXB2 Location p24 (82–92)

Epitope `LHPVHAGPI`
Subtype B
Immunogen HIV-1 infection, peptide-HLA interaction
Species (MHC) human
Assay type CD8 T-cell Elispot - IFNγ
Keywords immunodominance
References Rolland *et al.* 2007b

- Resemblance between viral and host peptides may preclude immune reactivity against such epitopes. This was shown using ELISpot to test recognition against the entire viral genome

in 314 HIV-infected subjects. Also, 944 overlapping Nef variants were tested for 30 patients. This inverse relationship between similarity of HIV epitope to host proteome and its immunogenicity has implications in vaccine design.
- Other factors, however, like entropy effects and forbidden residue usage or even hydrophobicity or disorder prediction scores were more influential than this similarity to self, with regards to immunogenicity of HIV-1. Also, forbidden aa ratios at the C-terminus of CTL epitopes and similarity to host proteins are positively correlated. Low disorder peptides elicit broader CTL responses and are better recognized.
- This HIV-1 epitope, LHPVHAGPI, is similar to human protein PTPRE, sequence LnPVHAGPIV and human protein T cell leukemia Homeobox 1, sequence LHPgHAePIV.

HXB2 Location p24 (83–92)
Author Location p24 (215–223 IIIB)
Epitope `VHPVHAGPIA`
Immunogen HIV-1 infection
Species (MHC) human (B55)

Country United Kingdom
Assay type Flow cytometric T-cell cytokine assay, Other
Keywords HAART, ART, immunodominance, TCR usage, memory cells
References Weekes *et al.* 2006
- The effect of HAART on the population size, phenotype and function of HIV- and HCMV-specific CTL clones was analyzed. It was determined that the clonal composition of gag and env HIV-specific CD8 T-cells did not change after HAART. Following HAART, the size of immunodominant HIV-specific CD8 T-cell clones was found to diminish even with the relative preservation of functional memory responses. Maintainance of such strong functional responses implied the preferential loss of HIV-specific cells that have reduced cloning efficiency in vitro. HCMV-specific CTL clones had different kinetics and phenotypes than HIV-specific CTL clones in the same subject.

Keywords HAART, ART, mother-to-infant transmission, rate of progression, co-receptor, immune evasion, HLA associated polymorphism
References Reinis *et al.* 2007

- HIV-1 mother-to-child transmission is studied for LTNPs by comparing entire genomes from 2 mother (M1, M2) and 2 daughter (D1, D2) RNA samples of a mother-child pair over 11 years. Genetic distance was 94% between subjects' strains. Divergence in sequences was attributed to distinct HLA selection pressures as ds/dn was larger for intra- rather than inter-person sequences. 10 new mutations in D2 were found related to unique daughter HLA alleles.
- Functional ELISpot studies using D2 and Nef peptides reveal strong associations between CTL responses and escape variants, contributing to delayed progression.
- LTNP status was not related to defective virus since all viral genes were intact and CTL response did not effectively control viral load. It is supposed that genetic HLA background and HIV-1 epitope-immune response interaction account for nonprogression of disease.
- All isolates contained R77Q in Vpr, a variation associated with reduction of cellular apoptosis.
- This HLA-A2 restricted epitope, HAGPIAPGQMREPRG was mutated to qAGPIAPGQMREPRG in the daughter D2 isolate.

References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- Predicted epitope based on an HLA motif embedded in a reactive peptide from a person carrying a D clade Gag.

- An individual infected with a drug-resistant strain of HIV-1 subtype B with controlled viremia became superinfected with another subtype B strain. The second strain outgrew the first despite lower replication capacity and the same viral phenotype. The strains showed differences in their epitope sequences. The CTL responses to the first strain declined after superinfection, followed by some adaptation of targeting to the new epitopes of the second strain. Differences in the recognized epitopes were suggested to have contributed to the poor immune containment of the second strain.
- An early response to this peptide was detected that waned prior to superinfection. The embedded epitope and HLA presenting molecule were not resolved. The initial and superinfecting strains carried a perfect match to the peptide sequence.

References Leligdowicz *et al.* 2007

- To find the factors involved in attenuated disease course and long term non-progression, HIV-2 and immune control were studied. HIV-2 viral load was used as a predictor of patient survival. HIV-2 viral load correlated inversely with magnitude of IFN-gamma response, relative dominance of Gag-specific peptides' responses over other proteins' responses, and the breadth of different peptide-specific immune responses. The most frequently recognized peptides were in Gag protein, followed by Env and Pol, while Nef and accessory proteins (Vif, Vpx, Vpr, Tat and Rev) rarely elicited responses. The 6 most recognized peptides were clustered in a highly conserved region of Gag.
- This peptide, SDIAGTTSTVDEQIQWMY, was recognized by 10 out of 65 subjects. It is found in the 149 amino-acid long HIV-2 proteome region of Gag 175-323.

Keywords escape
References Bailey *et al.* 2006b

- Impact of CTL escape mutations in HLA-B57 positive elite supressors was examined. Escape mutations in B57-restricted Gag epitopes were present in all viruses derived from plasma but were lacking in proviruses, suggesting a strong selective pressure acting upon virus in plasma. IFN-gamma responses were detected to both wild-type epitopes and mutant plasma virus epitopes. In some individuals, CD8 IL-2 secretion, rather

than IFN-gamma responses, showed better correlation with the plasma viral variants.
- Several mutations in this epitope were found to potentially act as CTL escape mutations. These are: E245D, G248E, and a triple mutation Q244T/I247V/G248A.

Keywords rate of progression, escape, viral fitness and reversion, drug resistance
References Bailey *et al.* 2007
- In this study the entire HIV-1 genome was analyzed before and after virologic escape for the first time and escape mutations were temporarily associated with an increased viremia in an otherwise B*57-elite controller of viral load. It is suggested that HLA-B*57-restricted CTL mutations were the major cause of escape because other multiple drug resistance mutations in Pol and RT (M184V and T215Y) did not result in a marked increase in viral replication capacity in vitro.
- CTLs detecting this Gag epitope, TSTLQEQIGW, were detectable and levels remained unchanged over 20 months. TW10 changed over time from TSTLQEQIaW to TSTLQEQIgW to TSTLQEQIeW to TSTLQEQIdW.

Keywords rate of progression, compensatory mutation
References Bailey *et al.* 2008
- This is the first documentation of transmission of HIV-1 from a patient who developed AIDS (Progressor) to an Elite Supresssor (ES).
- Both patients are HLA-B*5703-positive. The ES also has B*27 allele. Escape mutations in HLA-B*57-restricted epitopes were present in both patients, suggesting that they by themselves cannot explain the difference in the outcomes.
- The study concluded that viral replication is controlled in ES by at least two mechanisms: (i) direct inhibition of viral replication by polyfunctional HIV-1 specific CD8+ T cells that proliferate in response to autologous viral peptides; (ii) selection for and maintenance of escape mutations that have a negative impact on viral fitness.
- In this epitope, all isolates from both patients contained T242N mutation, the ES had also G248A mutation (TSnLQEQIaW) and the Progressor had also G248T mutation (TSNLQEQItW). In the previous studies T242N has been shown to affect the fitness of the virus, and compensatory mutations were shown to restore the fitness of T242N containing isolates. Here, the isolates from the Progressor, but not the ES had compensatory substitutions (H219Q and M228I). The uncompensated T242N mutation likely contributes to the reduced fitness of the isolates from the ES.

Keywords escape

References Carlson *et al.* 2008

- A statistical model, the phylogenetic dependency network (PDN), was developed to differentiate the confounding effects of codon variation, linkage disequilibrium of HLA alleles and HIV phylogeny from HLA-associated evolution including HIV selection by HLA-pressure and codon evolution.
- This approach was applied to 2 cohorts of 1144 Gag sequences from HIV-infected individuals, generating associations between HIV codons themselves and codons with HLA alleles. Results generated predicted escapes that confirmed that escape kinetics and compensating mutations are consistent across clades. General patterns of covariation and CTL adaptation were determined. Some clade-based differences were identified.
- HLA-B*57-restricted TW10, TSTLQEQIGW, has an escape mutation, T242N, TSnLQEQIGW which can partially abrogate B*57 binding, but comes with fitness cost. PDN confirms that partial compensatory mutations to offset fitness cost are found in H219Q, I223V and M228I.
- T242N, TSnLQEQIGW, also predicts G248A, TSTLQEQIaW as well as E210D. G248A, TSTLQEQIaW, predicts compensatory substitutions V218A and M228V; while G248T, TSTLQEQItW, predicts H219Q and M228I. These are examples of distal compensations where compensatory mutations are distal in three-dimensional space but alter functional dependencies.
- A putative epitope, pSG9, showed escape that was correlated with escape at this epitope, TW10 (as well as epitopes IW9, ISPRTLNAW, and QW9, Gag 308-316).

Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, escape, viral fitness and reversion, HLA associated polymorphism
References Frater *et al.* 2007

- To study whether CTL responses restricted by "good" HLA I molecules exert stronger immune selection than other HLA I molecules, 54 and 70 optimal epitopes within HIV-1 Gag, Pol and Nef genes for Caucasian and African cohorts were tested in patients over a mean of 14 months. "Good", advantageous HLA allele-restricted epitopes were much more polymorphic than epitopes restricted by other, non-advantageous HLA in patients, suggesting that benefits associated with HLA Class I alleles of elite controllers of disease progression are epitope-specific. Such "driver" epitopes with high polymorphism had high frequency of immune response, allowing them to be ranked for recognition and polymorphism.
- Patients with higher proportions of mutated epitopes also had lower plasma viral loads, and mean epitope variability correlated negatively with relative hazard of disease progression.
- Variants TSnLQEQIGW and TSTLQEQIaW at positions 3 and 9, were present in 86.7% of HLA-matched patients and 28.3% of HLA-unmatched patients. Phylogenetic analysis identified the threonine at position 3 to be under strong positive selective pressure.

Keywords escape, immune evasion, viral fitness and reversion, HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- Escape (and reversion) rates for B*57-restricted epitopes were highest for Gag-TW10 (TSTLQEQIGW) > RT-IW9 (IVLPEKDSW) > Nef-YY9 (YTPGPGIRY) > Nef-HW9 (HTQGYFPDW) > Gag-IW9 (ISPRTLNAW) > Gag-KF11 (KAFSPEVIPMF) .
- HLA-B*58 and B*57-associated substitutions within optimally defined epitope TSTLQEQIGW are at positions T3 and G9, TStLQEQIgW. TW10, restricted by the protective HLA-B*57 allele, was most rapidly escaping, evolving and frequently targeted (70%). Escape mutations at codon 172 were the most rapidly reverting in Gag-TW10.

Country South Africa
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, escape, viral fitness and reversion, compensatory mutation
References Chopera *et al.* 2008

- Transmission of HIV-1-escape variants from individuals with protective HLA-B*57/-B*5801 alleles to those without these alleles was studied to determine if infection with such replication-deficient mutants offered any advantage to the new host. Dependency between slower rate of disease progression in the newly infected subject and protective genotype of the infecting individual was suggested.
- 2 Gag polymorphisms in epitopes TW10 (TSTLQEQIAW) and ISW9 (ISPRTLNAW) associated with low viral loads and high CD4+ counts during acute and chronic infection were followed in HLA-B*57 and HLA-B*5801 negative subjects for minimum 12 months. A correlation was suggested between rate of disease progression and genotype of the individual HLA-B*57/-B*5801 positive) from whom virus was contracted.
- Epitope TW10, TSTLQEQIAW, was found with mutation T242N to TSnLQEQIAW, an escape mutation in 6/21 subjects. 2 of 9 individuals carrying T242N and another mutation, A146X, had compensating H219Q to partially restore replicative fitness. While A146X/T242N+ subjects show no significant difference from A146X/T242N- subjects in magnitude or breadth of CTL response to other Gag-epitope-containing peptides, they do have lower viremia.
- Over time, reversion to consensus sequence at position 242 was seen. Other variants of TW10 found were (T)TSTLQEQIAW(i), (T)TSnLQEQIvW(M), (T)TSsLQEQIAW(M), (T)TSTLQEQvAW(M), (T)TSTLaEQIAW(M) and (T)TSTLQEQIAW(i).

- Escape patterns of TSTLQEQIGW epitope were studied in 258 C-clade infected subjects from Durban, South Africa, and 187 B-clade infected subjects from diverse sources. 206 subjects were B*57/5801-positive.
- TS[t/n]LQEQIGW (T242N) escape mutation was present in 153/206 of B*57/5801-positive subjects and only in 2/239 B*57/5801-negative subjects.
- TS[t/n]LQEQIGW (T242N) mutation reduced viral replicative capacity based on in-vitro growth competition assays, supporting the inference of a fitness cost of T242N mutaion from observations of reversion in B*57/5801-negative subjects.
- Structural analysis suggested a critical role for T in Gag 242 position in defining the start point and in stabilizing helix 6 with p24 Gag, explaining the significant cost of escape.
- TW10-associated mutations were found in Gag positions 248,250,252 and for each a strong association with a potential compensatory mutation(s) was identified.

Epitope TSTLQEQIGW
Immunogen HIV-1 infection
Species (MHC) human (B*5701)
Country Australia
Assay type CD8 T-cell Elispot - IFNγ
Keywords escape, HLA associated polymorphism
References Bhattacharya *et al.* 2007

- Host HLA associated mutational patterns in HIV can be a consequence of immune escape, but to cleanly resolve whether or not such patterns are the result of lineage effects or immune pressure, it is helpful to incorporate the phylogenetic history of the virus into the test statistics. Most of the HLA associations that appeared to result from immune escape in an earlier study (Moore et al., Science 296:1439 2002) were found to be a consequence of the phylogenetic history of the virus, not immune escape. Other HLA associations were validated, and some additional HLA-associated mutations were identified through incorporating the viral phylogenetic tree in the analysis.
- The third position of this epitope TStLQEQIGW has a mutational pattern that is correlated with the host carrying HLA B*5701.

Epitope TSTLQEQIGW
Epitope name TST
Immunogen HIV-1 infection
Species (MHC) human (B*5701)
Assay type CD8 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords rate of progression, TCR usage, variant cross-recognition or cross-neutralization, characterizing CD8+ T cells
References Turnbull *et al.* 2006

- Functional cross-reactivity of CD8 responses to HIV-1 epitopes restricted by different HLA-alleles was analyzed. It was shown that epitope-specific responses with the most efficient cross-recognition were strongly associated with delayed disease progression. Variant-cross recognition efficiency was linked to the dominant TCRs used for epitope recognition. Epitopes restricted by the same HLA-allele did not show similar variant cross-recognition efficiency, suggesting that the rate of disease progression might be associated with the quality of responses to certain critical epitopes.
- This epitope, B57-TST (that is strongly associated with delayed progression to AIDS) and its alanine-substituted variants are efficiently cross-recognized.

Keywords rate of progression, escape, HLA associated polymorphism
References Frater *et al.* 2007

- To study whether CTL responses restricted by "good" HLA I molecules exert stronger immune selection than other HLA I molecules, 54 and 70 optimal epitopes within HIV-1 Gag, Pol and Nef genes for Caucasian and African cohorts were tested in patients over a mean of 14 months. "Good", advantageous HLA allele-restricted epitopes were much more polymorphic than epitopes restricted by other, non-advantageous HLA in patients, suggesting that benefits associated with HLA Class I alleles of elite controllers of disease progression are epitope-specific. Such "driver" epitopes with high polymorphism had high frequency of immune response, allowing them to be ranked for recognition and polymorphism.
- Patients with higher proportions of mutated epitopes also had lower plasma viral loads, and mean epitope variability correlated negatively with relative hazard of disease progression.
- Variant TSnLQEQIGW at position 3 was often found in conjunction with a second polymorphism at positions 5, 8 or 9.

References Gillespie *et al.* 2007

- MHC can exert a protective effect on HIV-1 disease progression by the interaction of MHC Class I molecules with Killer Inhibitory Receptors (KIR) of the innate immune system. Here, KIR3DS1, a putative stimulatory receptor and allele of the inhibitory KIR3DL1, is studied. Bw4 MHC Class I proteins were implicated in this KIR's ligand specificity, but the authors were unable to generate binding of Bw4Ile80 tetramers in complex with epitopes to KIR3DS1 transiently expressed on 293-T cells, using a panel of HIV-epitopes differing at p7 and p8.
- This epitope, TSTLQEQIGW (MHC Class I restriction, serotype Bw4Ile80) complexed with MHC B*5801 as a tetramer was unable to bind KIR3DS1 at 4, 20 and 37C.

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

- TSTLQEQIAW (the consensus form in the C clade) responses dominate the immune response in HLA-B57 individuals, and this epitope is also recognized in HLA-B5801 individuals. TSnLQEQIAW is shown to be an escape mutant correlated with HLA-B57 and HLA-B5801 alleles. The variant can be transmitted to HLA-B57/B5801 negative individuals, but reverts to wild-type in those. A second escape mutation within the epitope is, however, maintained after transmission; TSNLQEQIGW is the most common from of the epitope in the B clade, and a G substitution to some other amino acid, often A, was frequently noted in B57+ individuals; transmission of these variants persist in the new host.

Keywords rate of progression, escape
References Gao *et al.* 2005b

- Three distinct HLA alleles known to alter the rate of AIDS progression were studied. B*57-mediated protection occurs early in infection and the protective effect of this allele subsides after CD4 cell count drops. In contrast, B*27 shows no protection against progression to CD4<200, but rather delays progression to an AIDS-defining illness after the CD4 counts have dropped. B*35-mediated rapid progression to AIDS is probably a function of early decline in CD4 counts.
- TW10 is typically the immunodominant B57 epitope. TW10 responses are rapid, and escape occurs but presumably with a fitness cost, because reversion occurs after the escape variant is transmitted to a B57- person. High CD4 counts may be maintained in individuals because of immune selection for a less fit form of the virus.

Keywords responses in children, mother-to-infant transmission, escape, acute/early infection
References Pillay *et al.* 2005

- HIV-specific CTLs in infants were shown to be able to select for viral escape variants early in life, despite a lack of escape with the same CTL specificity in the mother. Infant CTL responses may be compromised by transmission of escape variants that arose in the mother and also those that arose in the father, if the father was the source of the mother's infection.
- TSTLQEQIAW is the C consensus form of the epitope and the autologous form in the mother was TSTLQEQItW, and this was the form transmitted to her infant. The mother does not carry B57, and the B57 escape footprint was inherited paternally. By 33 weeks a new dominant form of the epitope had emerged in the infant, TSnLQEQIAW, and the consensus form was also present in the infant.

Keywords rate of progression, immunodominance, early-expressed proteins
References Altfeld *et al.* 2006

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.
- This epitope, TSTLQEQIGW (TW10), elicits the HLA-B57 restricted response that is most dominant of the immune responses generated.

Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, escape, immune evasion, viral fitness and reversion, optimal epitope
References Streeck *et al.* 2007a

- To characterize HIV-1 proteome areas that are targeted in early, effective CTL responses, two cohorts were studied. Responses in early infection were against fewer epitopes and of lower magnitude than during chronic infection. While no region of the proteome was favored, Nef was the predominant target based on length of proteins.
- When based on the expression of protective versus nonprotective HLA I alleles, it was found that HLA-B27 and -57 possessing slow progressors to disease directed the majority of their responses to Gag in early infection, as opposed to those with HLA-B*3501 or B*3502, i.e. rapid progressors to AIDS, who had negligible responses to Gag. As compared with HLA-B57-/B27- subjects and HLA-B35 subjects, HLA-B57+/27+ subjects responded most to the p24 component of Gag. By using overlapping peptides within Gag p24, two were picked as being consistently targeted, and both contained previously described epitopes TSTLQEQIGW and KRWIIL-GLNK.
- TSTLQEQIGW, i.e. epitope TW10 is one of two immunodominant epitopes targeted during early infection in long term non-progressors to AIDS. After the acute phase of infection most subjects develop a variant, TSnLQEQIGW. Reversion to wild type is seen rapidly upon viral transmission to an HLA-B57- individual.

Keywords characterizing CD8+ T cells
References Streeck *et al.* 2008a

- T-cells were studied for exhaustion and dysfunction in chronic HIV infection. Polyfunctionality of CTL immune response to HIV-1 decreased with persistence of antigen presence over time in chronic infection. CTL exhaustion can thus be halted by reduction in viral antigen load - either by ART or through escape mutations.
- PD-1, marker for activation and apoptosis increases over time, but it decreases when epitope mutations develop. CD127 however, is not impacted by viral escape.
- 61 days after first testing, epitope TSTLQEQIGW showed no variation in a treated patient. Previously published HLA-restriction for TW10 is HLA-B57.

Keywords computational epitope prediction
References Schellens *et al.* 2008

- Peptide prediction programs based on MHC binding, proteasomal cleavage and TAP transport were applied to select novel epitopes absent from the Los Alamos HIV database. 22 novel epitopes were tested by IFN-gamma ELISpot and 19 (11 HLA-B27 restricted, 8 HLA-B57 restricted) induced strong positive responses.
- Magnitude of response generated was similar to that of previously identified epitopes, but the number of individuals responding was lower. This could be explained by less stringent HLA-typing of subjects and perhaps high sequence variability within these novel epitopes.
- TW10, TSTLQEQIGW, is a known HLA-B57-restricted epitope used as a positive control for eliciting CTL IFN-gamma response.

Epitope name TW10
Immunogen HIV-1 infection
Species (MHC) human (B*5801, B57)
Keywords review, rate of progression, immunodominance, escape, acute/early infection, viral fitness and reversion
References Goulder & Watkins 2004

- This paper is a review of the role of CTL in HIV infection, and it uses the TW10 epitope as an example. HLA B*57 and B*5801 both can present this epitope, and are associated with successful containment of HIV infection. The early response to TW10 is immunodominant, and often followed by rapid escape due to the T->N substitution, tsNlqeqigw. Some long term survivors do not carry the escape form, possibly because the CTL response to this epitope is able to suppress viremia. Others do carry the N escape form, and presumably control viremia due to viral attenuation; in support of this the N rapidly back mutates to T in a new host, so there is likely to be a high fitness cost. In contrast, the epitope sometimes contains a G-> A substitution at position 9, and the A can persist in a new host after transmission.

Epitope TSTLQEQIGW
Epitope name TW10
Immunogen HIV-1 infection
Species (MHC) human (B*5801, B57)
Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay
Keywords responses in children, mother-to-infant transmission, escape
References Feeney *et al.* 2005

- Escape mutations in TW10 and other B57-restricted epitopes were shown to arise early in infants following perinatal infection. Some escape variants were likely to have been transmitted vertically, from HLA-B57/5801 positive HIV-1 infected mothers, while others arose during infancy in cases where the children inherited the B57/5801 allele paternally. In contrast to adults, the majority of children did not respond to TSTLQEQIGW but showed a robust response to the escape variants, suggesting that infants are able to mount functional immune responses and drive immune escape and that a developing immune system may exhibit greater plasticity in recognizing viral variants.
- TW10 was found to be more frequently recognized by adults than by children. Among B57-positive subjects, TW10 was recognized by 10 out of 12 acutely infected adults, 11/22 chronically infected adults, and only 1/14 infected children. All 14 children carried mutations of this epitope, commonly T3N and G9A (TSnLQEQIaW), but the children were able to recognize the autologous variant. These mutations were rare in adults. One child carried T3N, Q5A, and G9A, and also recognized the autologous variant, TSnLaEQIaW.

Keywords HLA associated polymorphism
References Rousseau *et al.* 2008

- 3 phylogenetic correction methods—MLL (maximum likelihood character state analysis followed by likelihood ratio test), MLF (maximum likelihood character state analysis followed by Fisher test), and parsimony character state analysis were used to identify points in the HIV-1 subtype C proteome that conferred susceptibility or resistance to CTLs. Associations of HLA-epitope combinations that were inferred to be susceptible or resistant were organized into immunological sets that would help identify the best residues and genes as candidates for vaccines. While all proteins were interrogated, Gag, Pol, Env and Nef were focused upon. Amino acid changes were evaluated for association with plasma viral load.

- Proteome maps may be seen at `http://www.hiv.lanl.gov/content/immunology/hlatem/study5/index.html` with information showing single or multiple sites involving escape and reversion.
- HLA- B and -C alleles associated more with aa changes than HLA-A, suggesting that the former two are more important in driving viral evolution.
- The ratio of susceptible to resistant residues in HIV proteins was in descending order, Vpr>Gag>Rev>Pol>Nef>Vif>Tat>Env>Vpu, showing that epitopes from the earlier proteins are more conserved owing to viral fitness cost upon mutation.
- This previously described Gag p24 HLA B*57 or B*5801-restricted epitope, TSTLQEQIGW was susceptible at T3. Variants TSnLQEQIGW and TSsLQEQIGW were resistant to CTL response, but associated with lower viral loads. This epitope is 1 of 7 that suggest a fitness cost to immune escape.

Assay type CD8 T-cell Elispot - IFNγ
Keywords binding affinity, acute/early infection, early-expressed proteins, cross-presentation by different HLA
References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- This epitope was recognized in three of the acutely infected individuals and was presented by both HLA-B57 and B58.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.

Assay type Intracellular cytokine staining
Keywords escape, TCR usage, variant cross-recognition or cross-neutralization, characterizing CD8+ T cells, HIV-2
References Lopes *et al.* 2003

- CD8+ T cells from HIV-2 infected patients had more polyclonal TCR responses than HIV-1 infected patients, who tended to have oligoclonal responses. This results in limited plasticity of T cell responses to amino acid substitutions within epitopes in HIV-1 infections. HIV-2-specific CD8+ T-cells showed a more diverse TCR usage associated with enhanced CD8 expansion and IFN-gamma production on cross-recognition of variant epitopes.
- This peptide was recognized by a CD8+ T-cell clonotype with Vbeta5.1 usage in one HIV-1 infected patient, and all HIV-1 patients had narrow TCR usage, while HIV-2 patients used multiple TCR Vbeta chains. The HIV-2 variant of this peptide is: tstVEeqiQw. 5/6 HIV-2 infected individuals could recognize both the HIV-1 and HIV-2 peptides, while 0/5 HIV-1 infected patients that could react with the HIV-1 peptide could also react with the HIV-2 peptide.

Assay type CD8 T-cell Elispot - IFNγ
Keywords binding affinity, subtype comparisons, acute/early infection
References Malhotra *et al.* 2007b

- T-cell responses to clade B Gag peptides were tested using sequences based on consensus (CON), most recent common ancestor (ANC) and center of tree (COT); as well as CON sequences from clade A, clade C and M-group Gag. It was found that Gag-specific cross-clade T-cell IFN-gamma responses are detectable during primary infection, and there was no significant difference in breadth or magnitude of responses with the different peptide sets. While several epitopes in low diversity domains are invariant across clades, other recognized variants

are seen outside HLA anchor positions. T-cell immunity often tolerates conservative or semi-conservative amino acid substitutions but changes presumed to be in TCR contact sites may abrogate epitope recognition.
- Epitope sequences for this eptiope, TW10 are invariant between CON B, COT B, ANC B and M-group. Cross-recognition is seen only to the C-clade variant. Anchor residues are at positions 2 and 10; while the A-clade variant contains a non-conservative change at position 4 to TSTpQEQIGW, and the C-clade variant has a semi-conservative substitution at position 9 to TSTLQEQIaW. Reduced avidity was seen with the clade-C variant. HLA-B57 and -58 restriction was inferred based on 4 subjects' possessing appropriate HLA class I allele and prior publication.

Assay type CD8 T-cell Elispot - IFNγ, HLA binding
Keywords HAART, ART, escape, viral fitness and reversion
References Asquith *et al.* 2006

- In order to reconcile apparent conflicts between a CTL-protective role as suggested by HLA-1 alleles associated with different rates of progression to AIDS, and a CTL non-protective role as suggested by the fact that virus clearance following ART is not impaired in advanced AIDS, a model is made that quantifies the efficiency of HIV-1-specific CTLs in vivo. As a surrogate for the actual rate of CTL-killing of infected cells, the model rests on calculating virus escape rate for an epitope and subtracting its reversion rate upon transmission to a non-restricting HLA bearing host. It is shown that CTLs recognizing a single epitope kill only 2% of productively infected CD4+ cells. The rate of CTL lysis was found to be significantly faster during primary infection than in chronic infection. However, the authors suggest that small differences in CTL lysis rate can translate into large differences in terms of absolute numbers of infected cells killed, which are likely to be clinically relevant.
- The best estimate reversion rates for this epitope, TSTLQEQIGW, in 3 different subjects were found to be 0.016, 0, and 0.005/day with SEs of 0.007, 0, and 0.001 respectively.
- Gag p24 T110N confers escape in subjects expressing HLA-B57 and HLA-B5801. On transmission from an HLA-B57+ donor to an B57/B5801- recipient, the mutation rapidly reverted to wild type (a=0.016/day). Gag p24 G116A confers escape in subjects expressing B57 and B5801. On transmission from an HLA-B57+ donor to an B57/B5801- recipient, the mutation did not revert to wild type over the 8-year observation period, suggesting that the mutation was neutral (a=0/day). The escape variant in Gag p24 T110N was studied in a further HLA-B57+ to HLA-B57/B5801- transmission pair where it reverted to wild type (a=0.005/day).

Country Democratic Republic of the Congo
Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons, variant cross-recognition or cross-neutralization
References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype D Gag. The epitope sequence in this person had a single G8A change, STLQEQIaW.

Species (MHC) human (A*02)
Country China
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining, Other
Keywords assay standardization/improvement, optimal epitope
References Wang *et al.* 2007c

- HLA-A11-restricted CTL epitopes in 2 male Han Chinese subjects (one ART naive and one receiving HAART) were determined. A novel epitope was discovered and 5 other putative epitopes confirmed using 425 overlapping peptides spanning the entire HIV-1 clade B proteome. By employing intracellular cytokine staining, the authors developed a new method of mapping optimal epitopes and defining their HLA restriction efficiently. In spite of its being the most common HLA type in China, A*11-restricted epitopes were recognized less frequently than other epitopes, and A*11-restricted responses formed a mean of only 13% of the responses against HIV.
- This epitope, STLQEQIGWM, was detected within overlapping peptides SDIAGTTSTLQEQIGWM and WMTNNPPIPVGEIYKRWI.

References Fomsgaard *et al.* 2008

- Comparative genetic and immunological study was conducted of two subjects - patient DK1 with no viremia for >10 years after transient ART and despite continued sexual contact with patient UG1 (his wife) who was an HIV-1-positive non-controller.
- DK1 and UG1 shared most crossover points of recombination but while DK1 had subtype A1 Env, UG1's Env was subtype D. In the shared subtype A1/D regions, homology between the patients' sequences was 98%.
- Out of 23 conserved HLA-A02 epitopes, HLA-A2+ DK1 produced CTL response and IFN-gamma response only to epitope ILKEPVHGV.
- DK1 produced neutralizing antibody only to homologous isolates. It is suggested that early, transient ART may have resulted in full control of viremia and disease via the very narrow specific CTL response and neutralizing antibody.
- Despite carrying HLA-A2, DK1 did not respond to HLA-A2 Gag epitope TLQEQIGWM, though it did elicit response in a cohort of 11 other HIV-1 + HLA-A2+ patients. A variant of this epitope, sLQEQIGWM, was seen in DK1.

Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords binding affinity, immunodominance
References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This frequently targeted overlapping peptide, WMTNNPPIPVGEIYKRWI, was differentially targeted across ethnic groups and had an overall frequency of recognition of 16% - 25.4% AA, 23.1% C, 2.3% H, 9.5% WI (P value = 0.0035). This peptide is included in a 41 aa Gag-p24 highly reactive region to be used for vaccine design. HLA-B53 and -B8 were the most commonly present HLA alleles among individuals with responses to this peptide.

References Leligdowicz *et al.* 2007

- To find the factors involved in attenuated disease course and long term non-progression, HIV-2 and immune control were studied. HIV-2 viral load was used as a predictor of patient survival. HIV-2 viral load correlated inversely with magnitude of IFN-gamma response, relative dominance of Gag-specific peptides' responses over other proteins' responses, and the breadth of different peptide-specific immune responses. The most frequently recognized peptides were in Gag protein, followed by Env and Pol, while Nef and accessory proteins (Vif, Vpx, Vpr, Tat and Rev) rarely elicited responses. The 6 most recognized peptides were clustered in a highly conserved region of Gag.
- This peptide, MYRQQNPVPVGNIYRRWI, was recognized by 11 out of 65 subjects. It is found in the 149 amino-acid long HIV-2 proteome region of Gag 175-323.

References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness.

- Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- The mother was A02- and carried a variant form of the epitope, MThNPPIPV, which she passed to her A02+ child. This form persisted in her child for 12 months.

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 19% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Keywords HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-B*35-associated substitution within optimally defined epitope PPIPVGDIY is at positions D7, PPIPVGdIY.

References Streeck *et al.* 2007a

- To characterize HIV-1 proteome areas that are targeted in early, effective CTL responses, two cohorts were studied. Responses in early infection were against fewer epitopes and of lower magnitude than during chronic infection. While no region of the proteome was favored, Nef was the predominant target based on length of proteins.
- When based on the expression of protective versus nonprotective HLA I alleles, it was found that HLA-B27 and -57 possessing slow progressors to disease directed the majority of their responses to Gag in early infection, as opposed to those with HLA-B*3501 or B*3502, i.e. rapid progressors to AIDS, who had negligible responses to Gag. As compared with HLA-B57-/B27- subjects and HLA-B35 subjects, HLA-B57+/27+ subjects responded most to the p24 component of Gag. By using overlapping peptides within Gag p24, two were picked as being consistently targeted, and both contained previously described epitopes TSTLQEQIGW and KRWIIL-GLNK.
- PPIPVGDIY, i.e. epitope PY9 was targeted in 10% of rapid progressors to disease.

References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype D Gag. The autologous epitope sequence in this person matched the known epitope. In another D subtype infected individual, it was predicted to be a B53 epitope based on HLA typing of the individual and motifs within the reactive peptide.

Epitope PPIPVGEIY
Subtype B
Immunogen vaccine
Vector/Type: lipopeptide *Strain:* B clade LAI *HIV component:* Env, Gag, Nef *Adjuvant:* QS21
Species (MHC) human (B7 supertype)
Assay type proliferation, CD8 T-cell Elispot - IFNγ, Chromium-release assay
Keywords vaccine-induced epitopes, variant cross-recognition or cross-neutralization
References Gahéry-Ségard *et al.* 2003

- After injection of an anti-HIV-1 lipopeptide vaccine and the booster injections, a response was observed in >85% of 28 volunteers, and a long-term immune response was observed in >50% of the volunteers. A positive effect of QS21 adjuvant was found for B-and CD4+T-cell responses. A higher number of CD8+ T-cell epitopes was induced after a fourth boost injection. This epitope was one of the 31 epitopes that the vaccinated volunteers responded to.

Assay type proliferation, CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Dyer *et al.* 2008

- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.
- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- Peptide 65 (NIH ARRP Cat# 7936), PVGEIYKRWIILGLN, which contains epitopes restricted by HLA-A24 and -B60 in different patients, elicited the following CTL responses: (1) for 12+ years in a former non-progressor who succumbed to non-AIDS death (2) for 22+ years in a living non-progressor.

Assay type CD8 T-cell Elispot - IFNγ, CD4 T-cell Elispot - IFNγ, Th support of CTL response, Chromium-release assay
Keywords vaccine-induced epitopes, Th1, Th2
References Gavioli *et al.* 2008

- It was demonstrated that co-immunization with Tat broadens in vivo epitope-specific CD8 and CD4 responses to heterologous proteins and thus can be considered as an adjuvant. Specifically, mice immunized with Gag and Tat, responded to 11 T cell Gag epitopes, 5 more than those detected in mice vaccinated with Gag alone. Mice immunized with Env and Tat, responded to 17 T cell Env epitopes, 12 more than those detected in mice vaccinated with Env alone.
- Co-immunization with Tat specificaly drove Th1 responses and did not affect Th2 responses.
- Both Th1 and Th2 responses against Tat were no significantly affected by co-immunization with Env.
- This epitope was recognized both by mice co-immunized with Gag and Tat, and by mice immunized with Gag alone.

Epitope PVGEIYKRWIILGLN
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Bailey *et al.* 2008

- This is the first documentation of transmission of HIV-1 from a patient who developed AIDS (Progressor) to an Elite Suppresssor (ES).
- Both patients are HLA-B*5703-positive. The ES also has B*27 allele. Escape mutations in HLA-B*57-restricted epitopes were present in both patients, suggesting that they by themselves cannot explain the difference in the outcomes.
- The study concluded that viral replication is controlled in ES by at least two mechanisms: (i) direct inhibition of viral replication by polyfunctional HIV-1 specific CD8+ T cells that proliferate in response to autologous viral peptides; (ii) selection for and maintenance of escape mutations that have a negative impact on viral fitness.
- This epitope elicited IFN-γ response in the ES. The ES had N271H substitution.

Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country Barbados, Haiti, United States
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords binding affinity, immunodominance
References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This frequently targeted overlapping peptide, PVGEIYKRWIILGLNKIV, was differentially targeted across ethnic groups and had an overall frequency of recognition of 22% - 30.5% AA, 42.3% C, 9.1% H, 4.8% WI (P value = 0.001). This peptide is included in a 41 aa Gag-p24 highly reactive region to be used for vaccine design. HLA-B27 and -B8 were the most commonly present HLA alleles among individuals with responses to this peptide.

Country Guinea-Bissau
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining, Other
Keywords rate of progression, optimal epitope, HIV-2
References Leligdowicz *et al.* 2007

- To find the factors involved in attenuated disease course and long term non-progression, HIV-2 and immune control were studied. HIV-2 viral load was used as a predictor of patient survival. HIV-2 viral load correlated inversely with magnitude of IFN-gamma response, relative dominance of Gag-specific peptides' responses over other proteins' responses, and the breadth of different peptide-specific immune responses. The most frequently recognized peptides were in Gag protein, followed by Env and Pol, while Nef and accessory proteins (Vif, Vpx, Vpr, Tat and Rev) rarely elicited responses. The 6 most recognized peptides were clustered in a highly conserved region of Gag.
- This peptide, PVGNIYRRWIQIGLQKCV, was recognized by 9 out of 65 subjects. It is found in the 149 amino-acid long HIV-2 proteome region of Gag 175-323.

Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Assay type T-cell Elispot
Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 19% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Keywords rate of progression, immune evasion
References Kemal *et al.* 2008

- An LTNP was followed longitudinally over 6 years and 3 sampling time points, until transition to disease. His HLA were heterozygous and not associated with nonprogressive infection, but 3 alleles were associated with poor clinical prognosis. No attenuating mutations in initial samplings, but an insertion in the V2 loop and continuing CCR5 coreceptor use were found.
- A decrease in IFN-gamma response was seen over time, suggesting CTL dysfunction. An increase in T-cell epitopes targeted (e.g. emergence of YL8, YLKDQQLL and WY20, WKFDSRLAFHHMARELHPEY variants and gain of response to EL9, EIKDTKEAL, NL10, NSNPDCKTIL, AK9, AIFQSSMTK, WM8, WSMVRERM, VT15, WVHHTQGYFPDWQNYT) was seen concomitant with disease progression, reflecting viral replication and/or variants.
- HLA-B*08-restricted autologous epitope GEIYKRWII elicited CTL responses at the earliest time point, with a reduction in response frequency just before disease progression at the second time point and an increase at the third sample point. HLA restriction was predicted in this study based on the patient's HLA alleles and previous publication.

Assay type CD8 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords rate of progression, TCR usage, variant cross-recognition or cross-neutralization, characterizing CD8+ T cells
References Turnbull *et al.* 2006

- Functional cross-reactivity of CD8 responses to HIV-1 epitopes restricted by different HLA-alleles was analyzed. It was shown that epitope-specific responses with the most efficient cross-recognition were strongly associated with delayed disease progression. Variant-cross recognition efficiency was linked to the dominant TCRs used for epitope recognition. Epitopes restricted by the same HLA-allele did not show similar variant cross-recognition efficiency, suggesting that the rate of disease progression might be associated with the quality of responses to certain critical epitopes.
- This epitope, B8-GEI, that is associated with rapid progression to AIDS, and its natural as well as alanine-substituted variants are either not cross-recognized or show high interpatient variability in cross-recognition. At lower peptide concentrations, efficiency of variant cross-recognition was reduced, even while interepitopic differences in variant cross-recognition efficiency were maintained. CTLs responding to this epitope expressed the same predominant TCR Vbeta family.

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Immunogen vaccine
Vector/Type: lipopeptide *Strain:* B clade LAI *HIV component:* Env, Gag, Nef *Adjuvant:* QS21
Species (MHC) human (B8)
Assay type proliferation, CD8 T-cell Elispot - IFNγ, Chromium-release assay
Keywords vaccine-induced epitopes, variant cross-recognition or cross-neutralization
References Gahéry-Ségard *et al.* 2003

- After injection of an anti-HIV-1 lipopeptide vaccine and the booster injections, a response was observed in >85% of 28 volunteers, and a long-term immune response was observed in >50% of the volunteers. A positive effect of QS21 adjuvant was found for B-and CD4+T-cell responses. A higher number of CD8+ T-cell epitopes was induced after a fourth boost injection. This epitope was one of the most frequently recognized of the 31 epitopes that the vaccinated volunteers responded to.

Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons
References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype D Gag. The autologous epitope sequence matched the peptide.

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

References Draenert *et al.* 2004c

- CD8+ T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2-39) epitopic regions were targeted in an average of 6 proteins (range, 1-8). HAART resulted in decrease in antigen and reduction in gamma IFN EliSpot responses, suggesting active responses to autologous virus. The lack of mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN-based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- 3 subjects recognized this epitope with intermediate functional avidity. Autologous sequence revealed one substitution, Diyrkwil, in 1 of the 3; this version of the epitope also had intermediate functional avidity with the donor's cells.

- T-cell responses to clade B Gag peptides were tested using sequences based on consensus (CON), most recent common ancestor (ANC) and center of tree (COT); as well as CON sequences from clade A, clade C and M-group Gag. It was found that Gag-specific cross-clade T-cell IFN-gamma responses are detectable during primary infection, and there was no significant difference in breadth or magnitude of responses with the different peptide sets. While several epitopes in low diversity domains are invariant across clades, other recognized variants are seen outside HLA anchor positions. T-cell immunity often tolerates conservative or semi-conservative amino acid substitutions but changes presumed to be in TCR contact sites may abrogate epitope recognition.
- Epitope sequences for this eptiope, EI8 are invariant between CON B, COT B, ANC B and M-group. Cross-recognition is seen to both A- and C-clade variants. Anchor residues are at positions 4 and 5; while both A- and C- variants contain a

CTL CD8+

change at position 1 to dIYKRWII. HLA-B08 restriction was inferred based on subject possessing appropriate HLA class I allele and prior publication.

Epitope `EIYKRWII?`
Epitope name EI8
Immunogen HIV-1 infection
Species (MHC) human (B8)
Country United States, South Africa
Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding
Keywords memory cells
References Wherry *et al.* 2006

- Cohorts of HIV-infected subjects from the US and South Africa were screened for CD8+ EliSpot responses. Tetramer assays were performed for 13 frequently targeted HIV epitopes and compared to Flu, vaccinia, and EBV epitopes assayed in non-HIV-infected subjects. HIV tetramer+ CD8 T cells expressed less CD127, and this reduction was pervasive across all epitopes and alleles tested. These results indicated impaired HIV-specific memory CD8 T cell differentiation, regardless of level of control of viremia, epitopes targeted, or HLA alleles.

Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding, Flow cytometric T-cell cytokine assay
Keywords characterizing CD8+ T cells
References Streeck *et al.* 2008a

- T-cells were studied for exhaustion and dysfunction in chronic HIV infection. Polyfunctionality of CTL immune response to HIV-1 decreased with persistence of antigen presence over time in chronic infection. CTL exhaustion can thus be halted by reduction in viral antigen load - either by ART or through escape mutations.
- PD-1, marker for activation and apoptosis increases over time, but it decreases when epitope mutations develop. CD127 however, is not impacted by viral escape.
- 350 days after first testing, this epitope, EIYKRWII, decreased from triple-functional to monofunctional in the nature of response it was able to elicit in untreated patients, without any change in sequence. Previously published HLA-restriction for EI8 is HLA-B8.

Keywords vaccine-induced epitopes
References Horton *et al.* 2006b

- T cell responses during early infection in individuals previously enrolled in HIV vaccine trials were compared with those of nonvaccinated subjects.
- None of the breakthrough infections possessed vaccine-induced T-cell responses preinfection and 85-86% of vaccinees and nonvaccinees with primary infection developed T-cell responses postinfection, indicating that vaccinees' ability to mount T-cell response postinfection is not compromized by previous immunization.
- Breakthrough subjects recognized 43 T-cell epitopes, 8 of them novel, and 25% were present in the vaccine.
- This epitope was contained in the vaccine, the vaccinated patient recognized it after infection.

Immunogen HIV-1 infection
Species (MHC) human
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining, Other
Keywords binding affinity, acute/early infection
References Lichterfeld *et al.* 2007b

- Differences in early versus chronic AIDS include a decline in CTL number accompanied by a reducing viremia. Comparative analysis of such CTLs in this study show that early infection is characterized by a different clonotypic composition and higher functional avidity of CTLs followed by their selective depletion during transition to chronic disease. The total magnitude of CTL cytokine production is lower in early infection. Intraindividual, early CTLs' functional avidity for the same epitope decreases concomitantly with a reduction in clonotypic TCR repertoire especially of strongly activated and CD127lo, CD38+, Ki-67hi CTLs while progressing to chronic infection states.
- None of the target epitopes, including this epitope EIYKRWII seen in 2 patients, underwent sequence changes.

Keywords dynamics, acute/early infection, characterizing CD8+ T cells
References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape,within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape muations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

CTL CD8+

- To clarify mechanisms of escape mutation accumulation in the population, the Japanese Nef138-10 (RYPLTFGWCF) epitope was studied amongst hemophiliacs and others, to determine replication suppression abilities of both the wild type and 2F (RfPLTFGWCF) mutant virus. This mutant is conserved due to reduced CTL suppression of viral replication, also preventing viral reversion to WT upon transfer to a new host.
- Epitope Gag263-10, IYKRWIILG, was used as a comparison for positive cytolytic activity of epitope-specific HLA-A*2402 clones against target cells prepulsed with corresponding peptide. These clones partially suppressed NL-M20A viral replication.

Keywords rate of progression
References Dyer *et al.* 2008

- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.
- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- Peptide 66 (NIH ARRP Cat# 7937), IYKRWIILGLNKIVR, contains epitopes restricted by HLA-A24 and -B27 in different patients and elicited the following CTL responses: (1) 1920 sfc/million PBMC at 12.5 years, and 2050 sfc/million PBMC at 22.8 years post-infection in a living non-progressor (2) for >22 years in another living non-progressor (3) for 22+ years in a former non-progressor who succumbed to loss of viremic control.

Keywords rate of progression, escape, HLA associated polymorphism
References Frater *et al.* 2007

- To study whether CTL responses restricted by "good" HLA I molecules exert stronger immune selection than other HLA I molecules, 54 and 70 optimal epitopes within HIV-1 Gag, Pol and Nef genes for Caucasian and African cohorts were tested in patients over a mean of 14 months. "Good", advantageous HLA allele-restricted epitopes were much more polymorphic than epitopes restricted by other, non-advantageous HLA in patients, suggesting that benefits associated with HLA Class I alleles of elite controllers of disease progression are epitope-specific. Such "driver" epitopes with high polymorphism had high frequency of immune response, allowing them to be ranked for recognition and polymorphism.
- Patients with higher proportions of mutated epitopes also had lower plasma viral loads, and mean epitope variability correlated negatively with relative hazard of disease progression.
- Variants KkWIILGLNK and KRWIImGLNK/KRWIIiGLNK at positions 2 and 6 were found. Phylogenetic analysis identified the leucine at position 6 to be under strong positive selective pressure.

References Brumme *et al.* 2008b

- A large chronically infected, treatment naïve cohort was studied to identify and organize HLA I-associated polymorphisms in Gag into an immune escape map. Insertion polymorphisms at p17 C-terminus were associated with HLA-B*44, -A*32, -C*05. Inverse correlations were found between number to HLA-associated sites and pVL as well as escaped Gag residues and pVL. pVL positively correlates with CD4 T-cell count. No enrichment for HLA-associated polymorphisms are seen at anchor residues, showing that CTL escape is primarily not through abrogation of peptide-HLA binding.
- B*27-restricted p24 KK10 epitope has HLA-associated substitutions at codons 264 and 268.

References Carlson *et al.* 2008

- A statistical model, the phylogenetic dependency network (PDN), was developed to differentiate the confounding effects of codon variation, linkage disequilibrium of HLA alleles and HIV phylogeny from HLA-associated evolution including HIV selection by HLA-pressure and codon evolution.
- This approach was applied to 2 cohorts of 1144 Gag sequences from HIV-infected individuals, generating associations between HIV codons themselves and codons with HLA alleles. Results generated predicted escapes that confirmed that escape kinetics and compensating mutations are consistent across clades. General patterns of covariation and CTL adaptation were determined. Some clade-based differences were identified.
- In these cohorts HLA-B27 is found to correlate with escape at position 264 of its restricted epitope KK10, KRWIILGLNK, to KkWIILGLNK and KgWIILGLNK. Moreover, most KK10 compensations are proximal where codon pairs in a compensatory pathway are in close proximity and are likely required to maintain structural fidelity.

CTL CD8+

- As reported before, the KkWIILGLNK mutation is preceded by L268M, KRWIImGLNK in this prediction. L268M, KRWIImGLNK, itself is predicted by the HLA, B*27. Substitution A146P is associated with wildtype L268 sequence.
- A replicative compensation, S173A, was previously described for R264K, KkWIILGLNK. A strong association was confirmed using PDN, with new associations with I267V, KRWIvLGLNK and L215M. I267V, KRWIvLGLNK is predicted by the substitution A163X.
- Another association confirmed by PDN is that E260D compensates for the R264G mutation KgWIILGLNK but not R264K. Also, regardless of position 260's being E in clade B and D in clade B, if a viral sequence possessed mutant R264G i.e. KgWIILGLNK, then it was always a 260D. KgWIILGLNK is strongly associated with the Q136R substitution.

Country Australia, Canada, Germany, United States
Keywords immune evasion, HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-B*27-associated substitutions within optimally defined epitope KRWIILGLNK are at positions R2 (R264K) and L6 (L268M), KrWIIlGLNK. In spite of being the most frequently targeted epitope in early infection, KK10 is only the 20th most rapidly evolving. 5/11 subjects selected R264K and 2 more selected both R264K and L268M.

Immunogen HIV-1 infection
Species (MHC) human (B*2705)
Keywords dynamics, acute/early infection
References Wilson *et al.* 2000a

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
- Tetramers with peptide variants KRWIILGGLNK and KRWIIMGGLNK were used – CTL from most B27 donors recognize both variants, although one of the three subjects recognized only KRWIILGGLNK.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWIILGGLNK.
- The subject with A*0201 had a moderately strong strong response to SLYNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

Keywords escape
References Kelleher *et al.* 2001b

- A mutation in 4/5 B*2705 patients had substitution to lysine (K) at HIV-1 gag residue 264 (R264K), in three the change occurred late in infection – in one patient a substitution of glycine at HIV-1 gag residue 264 (R264G) was detected – these substitutions reduce binding to B27.
- The R264K mutations were associated with a L268M mutation that may be compensatory, and R264G occurred in conjunction with E260D.
- Positions 260, 264, and 268 all lie along one aspect of helix seven of the capsid protein, a region that is important for capsid self-association and assembly.
- R264G and R264K escape mutation outgrowth occurred in conjunction with high viral loads.

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding, Intracellular cytokine staining, Chromium-release assay, Flow cytometric T-cell cytokine assay, Degranulation, CD107a and b cell surface mobilization
Keywords vaccine-specific epitope characteristics, vaccine-induced epitopes, immunodominance, escape, TCR usage, characterizing CD8+ T cells
References Betts *et al.* 2005

- A vaccinated HIV-negative individual exhibited features predicted to be necessary for vaccine-induced protection: killing ability, cytokine production, multifunctionality, proliferative capacity, polyclonality, memory phenotype, and a CD8 T-cell response directed against a highly immunodominant epitope correlated with long-term nonprogression. In spite of this, the subject became infected with HIV through homosexual contact. The subject progressed more rapidly than expected for an HLA-B27-positive individual.
- After infection, CD4+ and CD8+ T cells acquired functional characteristics typical of chronic HIV infection. The infecting virus escaped the vaccine-induced T-cell response with an R264G substitution, KgWIILGLNK, which diminishes binding to B27, between the second and third year of infection.

Assay type CD8 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords rate of progression, TCR usage, variant cross-recognition or cross-neutralization, characterizing CD8+ T cells
References Turnbull *et al.* 2006

- Functional cross-reactivity of CD8 responses to HIV-1 epitopes restricted by different HLA-alleles was analyzed. It was shown that epitope-specific responses with the most efficient cross-recognition were strongly associated with delayed disease progression. Variant-cross recognition efficiency was linked to the dominant TCRs used for epitope recognition. Epitopes restricted by the same HLA-allele did not show similar variant cross-recognition efficiency, suggesting that the rate of disease progression might be associated with the quality of responses to certain critical epitopes.
- This epitope, B27-KRW is very strongly associated with delayed disease progression and its alanine-substituted variants are highly efficiently cross-recognized.

- A variant of this epitope KK10, KRWIImGLNK (L6M), arises due to CTL escape and increases binding to Immunoglobulin-like transcritp-4 (ILT4), leading to functional inhibition of DCs. Not only was KK10-L6M not recognized by CTLs but other variants like R2K and R2T were. During chronic infection, this variant recruited an alternative TCRalpha and beta, being immunogenic enough to elicit a de novo CTL response. Finally, enhanced binding of this HLA-B*2705-KK10-L6M complex to ILT4 occurred, resulting in an impairment of DC function as measured by the markers HLA-DR, CD83, CD40, CD180 and CD86.

Assay type Chromium-release assay, Other
Keywords escape, compensatory mutation
References Schneidewind *et al.* 2008

- Variants at position R264 of epitope KK10, KRWIILGLNK, were studied in an in vitro coculture assay. HLA-B*27 subjects can control HIV-1 through its immunodominant epitope KK10. Escape at KK10 usually occurs through R264K, KkWIILGLNK, along with an upstream compensatory S173A mutation. While alternative mutations at R264 - KgWIILGLNK, KqWIILGLNK, KtWIILGLNK - have less severe replicative defects, R264K is still preferred. Viral replication is least impaired with the R264K plus S173A double mutant.
- Since the double variant, R264K+S173A, is the dominant one, and also has least impact on viral replication, it is suggested that functionally, a minimal threshold of HIV replication may be necessary to select the dominant quasispecies.
- During HIV-1 replication cycles, there is a bias in frequency of G-to-A substitutions, providing an initial structural reason for selection of the R264K mutation.
- Other KK10 variants that may be seen are KRWIImGLNK, KkWIImGLNK KqWIImGLNK and KtWIImGLNK.
- Upstream of KK10, 2 variants that may be seen are (1) the previously discussed, relatively common S173A change from PMFSALS (Gag170-176) to PMFaALS along with R264K,L268M (KkWIImGLNK); as well as (2) the rare change from PVGEIY (Gag257-262) to PVGdIY along with R264G, KgWIILGLNK. Both are double variants.

References Goulder *et al.* 2001b

- 85% of B27+ adults have CTL that recognize this epitope, but only 2/6 children did.
- Responses to this dominant B27-restricted Gag epitope are present during the time of decreasing viral load in acute infection.
- Three children who shared B27 with their mothers did not respond to this epitope and inherited escape mutations from their mothers.
- A transmitted R132T anchor residue mutation abrogated binding to B27.
- In the three children infected with the non-binding KK10 variants, the dominant CTL specificity was still HLA-B27-restricted, but it was directed against an epitope in p17, IRLRPGGKK, only rarely recognized in adults when KRWIILGLNK is the dominant response.
- Mutations in this epitope were observed in autologous clones of subjects who were B27-positive with a higher frequency than those who were B27-negative (P = 0.0005)
- These mutations are being sexually transmitted in adult infections.

CTL CD8+

- Ritonavir (RTV) inhibits chymotryptic activity in the 20S proteasome *in vitro*, as does Saquinavir (SQV) to a lesser extent; Indinavir (IDV) does not. Thus there is concern protease inhibitors may adversely effect CTL epitope processing, but this paper indicates that processing is not inhibited at therapeutically relevant concentrations of RTV when the proteasome is functioning in an intracellular context.
- RTV did not reduce antigen presentation and concentration of the two immunodominant Gag CTL epitopes (KRWIIMGLNK (B27) and SLYNTVATL (A2)).
- RTV did not inhibit the processing and assembly of HLA-B35 or -A2, which are assembled with a rapid and moderate time course, respectively, or of HLA-A3, -B27 and -B39.

Keywords HAART, ART, supervised treatment interruptions (STI)
References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient C displayed the greatest response to B27-KK10(p24), and in decreasing order also responded to A24-RW8(Nef), B7-IL9(gp41), A24-RL9(gp41), A24-YL8(gp41), and B7-TM9(Nef). Patient D also displayed the greatest response to B27-KK10(p24), and also responded to A30-RY11(p17), A32-PW10(RT), A30-KY11(RT), A32-RW10(gp120), and B18-YY9(Nef).

Keywords responses in children, rate of progression, immunodominance, escape
References Feeney *et al.* 2004

- Viral load in a perinatally infected child remained low until emergence of an escape variant (kTwiilglnk) in the immunodominant CTL epitope KRWIILGLNK when the child was 7.4 years old. The emergence of this escape mutation was followed by an increase in viremia and an increase in the number of targeted CTL epitopes, measured again when the child was 9.2 years old. The timing suggests that the loss of recognition of this epitope may have resulted in the subsequent loss of immune control.
- The mutation krwillMglnk has been suggested to be compensatory and required for the emergence of the previously described escape mutation kKwillMglnk (Kelleher 2001). The L136M mutation does appear in this child, but not in conjunction with the R132T escape mutation.

CTL CD8+

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognized epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.
- This epitope, KRWIILGLNK (KK10), elicits the HLA-B27 restricted response that is most dominant of the immune responses generated.

References Malhotra *et al.* 2007b

- T-cell responses to clade B Gag peptides were tested using sequences based on consensus (CON), most recent common ancestor (ANC) and center of tree (COT); as well as CON sequences from clade A, clade C and M-group Gag. It was found that Gag-specific cross-clade T-cell IFN-gamma responses are detectable during primary infection, and there was no significant difference in breadth or magnitude of responses with the different peptide sets. While several epitopes in low diversity domains are invariant across clades, other recognized variants are seen outside HLA anchor positions. T-cell immunity often tolerates conservative or semi-conservative amino acid substitutions but changes presumed to be in TCR contact sites may abrogate epitope recognition.
- This epitope, KRWIILGLNK, is invariant across CON A, B, C and M-Group sequences, as well as clade B COT and ANC sequences. HLA-B27 restriction was inferred based on subject possessing appropriate HLA class I allele and prior publication

- In order to reconcile apparent conflicts between a CTL-protective role as suggested by HLA-1 alleles associated with different rates of progression to AIDS, and a CTL non-protective role as suggested by the fact that virus clearance following ART is not impaired in advanced AIDS, a model is made that quantifies the efficiency of HIV-1-specific CTLs in vivo. As a surrogate for the actual rate of CTL-killing of infected cells, the model rests on calculating virus escape rate for an epitope and subtracting its reversion rate upon transmission to a non-restricting HLA bearing host. It is shown that CTLs recognizing a single epitope kill only 2% of productively infected CD4+ cells. The rate of CTL lysis was found to be significantly faster during primary infection than in chronic infection. However, the authors suggest that small differences in CTL lysis rate can translate into large differences in terms of absolute numbers of infected cells killed, which are likely to be clinically relevant.
- The best estimate of escape rates for this epitope, KRWIIMGLNK, were found in 3 subjects to be 0.002, 0.001 and 0.010/day, with SEs of 0.003, 0.003 and 0.011 respectively.
- The escape mutation was R132K in all cases.

- Since it is suggested that a single response to B27-KK10 epitope may be responsible for the association of HLA-B*2705 patients with AIDS-free survival, B27-KK10-specific CTLs were compared to other HLA-specific CTLs in phenotype, function, clonal diversity, and antigen sensitivity in 47 treatment-naive infected slow or nonprogressing patients.
- cVL, the cell-associated viral load (number of infected cells harboring HIV DNA) correlated inversely with Gag-specific CTLs. This was most significant in HLA-B27 donors, and KK10 was identified as the peptide generating strongest CTL responses.
- B27-KK10-specific CTLs had no significant phenotypic differences from other epitope-specific CTLs upon testing a large panel of markers; however, they released higher proportions of IFN-gamma, TNF-alpha, MIP-1beta and CD107a upon antigenic stimulation.
- B27-KK10-specific and other HLA-specific CTLs had strikingly consistent domination of single clonotypes. B27-KK10-specific CTLs showed no preferential usage of CDR3 motifs, indicating that they could be recognized by diverse clonotypes with differing binding properties. Over several years, B27-KK10-specific CTLs changed their dominant clonotype as compared to other CTLs. This temporal dominant clonal turnover was attributed to a decline in replicative capacity of

the dominant clonotype as seen by increases in CD57 expression, which is linked to replicative senescence.

- Studies involving functional avidity and different HLA-restricted responses proved that B27-KK10 responses had highest avidity. An inverse correlation between patient cVL and functional avidity of both dominant and highest subdominant responses suggested that functional avidity correlates with capacity to control HIV replication via infected cell elimination.
- Using the example seen in one patient, the authors stress the importance of maintaining protective stimulating activity of CTLs. When control by dominant clonotypes is lost, as in viral escape, ensuing viral replication is rapid.
- In one B27-positive patient studied, the dominantly-targeted epitope sequence changed over time from KRWIIMGLHK to KRWIIlGLnK. TCR sequences were studied in 11 patients.

- To characterize HIV-1 proteome areas that are targeted in early, effective CTL responses, two cohorts were studied. Responses in early infection were against fewer epitopes and of lower magnitude than during chronic infection. While no region of the proteome was favored, Nef was the predominant target based on length of proteins.
- When based on the expression of protective versus nonprotective HLA I alleles, it was found that HLA-B27 and -57 possessing slow progressors to disease directed the majority of their responses to Gag in early infection, as opposed to those with HLA-B*3501 or B*3502, i.e. rapid progressors to AIDS, who had negligible responses to Gag. As compared with HLA-B57-/B27- subjects and HLA-B35 subjects, HLA-B57+/27+ subjects responded most to the p24 component of Gag. By using overlapping peptides within Gag p24, two were picked as being consistently targeted, and both contained previously described epitopes TSTLQEQIGW and KRWIIL-GLNK.
- KRWIILGLNK, epitope KK10, is one of two immunodominant epitopes targeted during early infection in long term nonprogressors to AIDS. Only in later phases of infection, after accumulation of compensatory mutations do most subjects develop variants.

Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding, Flow cytometric T-cell cytokine assay
Keywords immunodominance, superinfection
References Streeck *et al.* 2008b

- Loss of viral replication control by an elite controller after superinfection was found to coincide with rapid recombination events in 2, ∼50 residue regions of Gag and Env that include immunodominant epitopes KK10 (KRWIILGLNK) and CL9 (CAPAGFAIL). Viral escape was seen at both epitopes and consequent CTL responses against the epitope-variants.
- Previously described epitope KRWIILGLNK is HLA-B27 restricted. Early immunodominance of the KK10-specific CTL response was followed by the stereotypical L268M escape to KRWIImGLNK and then its equivalent control via variant-specific CTLs. Variant R264K to KkWIILGLNK did not appear in the primary infection.
- Superinfection resulted in new immunodominances, a reversion to WT KK10 and later escape of the reverted WT KK10 to KkWIILGLNK (R264K), KRWIImGLNK, KRWvILGLNK and KkWIImGLNK. 2 distinct mutations accompanied this last studied escape, T239V and N252S.

References Alter *et al.* 2008

- By studying HIV-1 dysregulation of CTLs at different infection stages induced by inhibitory KIRs (Killer Immunoglobulin-like receptors), it was determined that KIR surface expression on memory T cells correlates with HIV replication. It results in reduced activation, proliferation, cytokine secretion, and killing following TCR stimulation. Since non-TCR-dependent CTL stimulation was unaffected, TCR-mediated stimulation appears to be defective. KIR induced suppression of CTL function was found to be KIR-ligand-independent.
- KK10-specific CTLs had heterogeneous surface expression of KIR. Of these tetramer positive B27-CTLs, only KIR- cells were able to secrete IFN-gamma upon stimulation. These KK10-specific, HLA-B27-restricted CTL were also used for an HIV inhibition assay.

References Dyer *et al.* 2008

- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.
- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- A broad CTL response was essential to elite control of disease. Immune escape at KRWIILGLNK was not a major cause of disease progression.
- Escape from the peptide sequence EIYKRWIILGLNK to dIYKgWIILGLNK was seen only in 1 subject who exhibited delayed progression to viremia and who initiated ART, but succumbed to non-AIDS death at age 83.

References McMichael 2007b

- This commentary summarizes work by Lichterfeld et al. [JEM Vol. 204: 2785-7 (2007)]. HLA-B27 restricted CTLs presented with epitope KK10 (KRWIILGLNK) are known to keep infection at bay in LTPs. However, a triple mutation resulting in viral escape can occur after several years. The mutations are L268M, R264K(T/G) and S173A. L268M occurs early in infection and becomes fixed when bound to HLA-B27, conferring unknown viral advantage that is suggested to be due to its 3-fold higher affinity for ILT4. This may result in impaired DC and monocyte function. It is thought that the triple mutations compensate for each other, stabilizing them.

Keywords vaccine-induced epitopes
References Horton *et al.* 2006b

- T cell responses during early infection in individuals previously enrolled in HIV vaccine trials were compared with those of nonvaccinated subjects.
- None of the breakthrough infections possessed vaccine-induced T-cell responses preinfection and 85-86% of vaccinees and nonvaccinees with primary infection developed T-cell responses postinfection, indicating that vaccinees' ability to mount T-cell response postinfection is not compromized by previous immunization.
- Breakthrough subjects recognized 43 T-cell epitopes, 8 of them novel, and 25% were present in the vaccine.
- This epitope was not contained in the vaccine, the vaccinated patient recognized it after infection.

Keywords binding affinity, acute/early infection
References Lichterfeld *et al.* 2007b

- Differences in early versus chronic AIDS include a decline in CTL number accompanied by a reducing viremia. Comparative analysis of such CTLs in this study show that early infection is characterized by a different clonotypic composition and higher functional avidity of CTLs followed by their selective depletion during transition to chronic disease. The total magnitude of CTL cytokine production is lower in early infection. Intraindividual, early CTLs' functional avidity for the same epitope decreases concomitantly with a reduction in clonotypic TCR repertoire especially of strongly activated and CD127lo, CD38+, Ki-67hi CTLs while progressing to chronic infection states.
- None of the target epitopes, including this epitope KRWIILGLNK seen in 1 patient, underwent sequence changes.

References Schneidewind *et al.* 2007

- Epitope KK10 in HLA-B27 slow progressors to disease varies late in infection, leading to AIDS. The predominant escape mutation for this epitope is R264K, and it severely compromises virus replication, late in reverse transcription but unrelated to capsid stability. This can be restored by an in vivo upstream compensatory mutation, S173A and modulation of CypA binding in the presence of cyclosporine A. However, the first mutation to arise is the L268M, a prerequisite compensatory mutation to R264K.
- Four HLA-B27 subjects' virus were sequenced longitudinally to find that the KK10 epitope mutates from KRWIILGLNK (WT) to KkWIILGLNK (R264K), KRWIILGmNK (L268M), KkWIImGLNK (R264K/L268M), KRWIILGLNK (S173A), KkWIILGLNK (S173A/R264K), KkWIImGLNK (S173A/R264K/L268M) and KkWIImGLNK (A237T on R264K/L268M).

References Weekes *et al.* 2006

- The effect of HAART on the population size, phenotype and function of HIV- and HCMV-specific CTL clones was analyzed. It was determined that the clonal composition of gag and env HIV-specific CD8 T-cells did not change after HAART. Following HAART, the size of immunodominant HIV-specific CD8 T-cell clones was found to diminish even with the relative preservation of functional memory responses. Maintainance of such strong functional responses implied the preferential loss of HIV-specific cells that have reduced cloning efficiency in vitro. HCMV-specific CTL clones had different kinetics and phenotypes than HIV-specific CTL clones in the same subject.

Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Immunogen HIV-1 infection
Species (MHC) human
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Bailey *et al.* 2008

- This is the first documentation of transmission of HIV-1 from a patient who developed AIDS (Progressor) to an Elite Suppresssor (ES).
- Both patients are HLA-B*5703-positive. The ES also has B*27 allele. Escape mutations in HLA-B*57-restricted epitopes were present in both patients, suggesting that they by themselves cannot explain the difference in the outcomes.
- The study concluded that viral replication is controlled in ES by at least two mechanisms: (i) direct inhibition of viral replication by polyfunctional HIV-1 specific CD8+ T cells that proliferate in response to autologous viral peptides; (ii) selection for and maintenance of escape mutations that have a negative impact on viral fitness.
- This epitope elicited IFN-γ response in the Progressor, who had H441Y substitution.

Keywords supervised treatment interruptions (STI), immunodominance, variant cross-recognition or cross-neutralization, characterizing CD8+ T cells, drug resistance
References Daucher *et al.* 2008

- A detailed analysis of 6 chronically infected patients' CTL responses to autologous virus was performed after ART and SIT (structured interruption of therapy). Qualitative responses including degranulation and production of IFN-gamma, MIP-1beta, TNF-alpha, IL-2, but not memory CD27, CD45RO and CD57 T cells correlated with extended low plasma viremia. Frequency and breadth of CTL response as well as immune escape did not influence virological outcome.
- One patient exhibited drug resistance mutations K170R (to NNRTI efavirenz) and D76N, K70R (to NRTIs).
- Data confirmed that autologous epitopes were preferentially recognized over optimal, consensus sequences.
- Patients with favorable virological outcomes demonstrated CTL recognition within multiple, conserved regions of Gag and Nef.
- Patients with poor virological outcomes recognized optimal epitopes with much lower frequencies, though this was not significant.
- HLA-A2 and -A3-restricted epitope, IILGLNKI, elicited a response in 1 patient and is found in Gag immunodominant region WIILGLNKIVRMYS. The patient autologous sequence was ImLGLNKI.

CTL CD8+

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized—the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized. A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Keywords dynamics, acute/early infection, characterizing CD8+ T cells
References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape,within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape muations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

References Reche *et al.* 2006

- 25 CTL epitopes with sequence conservation were studied. Population protection coverage (PPC) for 5 different ethnic groups in the US was estimated by combining HLA binding predictions and known HLA frequencies. HIV-1-naive individuals mounted a better response to the epitope pools than HIV-1 infected individuals.
- A more detailed evaluation of HIV-naive T-cell responses was undertaken, limiting the study to only those peptides that are restricted to A*0201. Though the peptides could cross-recognize and bind different HLA, they were able to specifically lyse only cells of the same (A*0201) HLA-restriction. Thus, the CTL response was less degenerate than peptide binding to MHC.
- In addition to the published restriction above, epitope GLNKIVRMY was predicted to be restricted by HLA A*0203, A1, B*1501.

References Draenert *et al.* 2004c

- CD8+ T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2-39) epitopic regions were targeted in an average of 6 proteins (range, 1-8). HAART resulted in decrease in antigen and reduction in gamma IFN EliSpot responses, suggesting active responses to autologous virus. The lack of mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN-based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- 1 subject recognized this epitope with intermediate functional avidity. The autologous sequence matched the B consensus.

CTL CD8+

CTL CD8+

References Daucher *et al.* 2008

- A detailed analysis of 6 chronically infected patients' CTL responses to autologous virus was performed after ART and SIT (structured interruption of therapy). Qualitative responses including degranulation and production of IFN-gamma, MIP-1beta, TNF-alpha, IL-2, but not memory CD27, CD45RO and CD57 T cells correlated with extended low plasma viremia. Frequency and breadth of CTL response as well as immune escape did not influence virological outcome.
- One patient exhibited drug resistance mutations K170R (to NNRTI efavirenz) and D76N, K70R (to NRTIs).
- Autologous epitopes were preferentially recognized over optimal, consensus sequences.
- Patients with favorable virological outcomes demonstrated CTL recognition within multiple, conserved regions of Gag and Nef.
- Patients with poor virological outcomes recognized optimal epitopes with much lower frequencies, though this was not significant.
- HLA-B15-restricted epitope, GLNKIVRMY, elicited a response in 1 patient and is found in Gag immunodominant region WIILGLNKIVRMYS.

Assay type CD8 T-cell Elispot - IFNγ
Keywords binding affinity, subtype comparisons, acute/early infection
References Malhotra *et al.* 2007b

- T-cell responses to clade B Gag peptides were tested using sequences based on consensus (CON), most recent common ancestor (ANC) and center of tree (COT); as well as CON sequences from clade A, clade C and M-group Gag. It was found that Gag-specific cross-clade T-cell IFN-gamma responses are detectable during primary infection, and there was no significant difference in breadth or magnitude of responses with the different peptide sets. While several epitopes in low diversity domains are invariant across clades, other recognized variants are seen outside HLA anchor positions. T-cell immunity often tolerates conservative or semi-conservative amino acid substitutions but changes presumed to be in TCR contact sites may abrogate epitope recognition.
- This epitope, GLNKIVRMY, is invariant across CON A, B, C and M-Group sequences, as well as clade B COT and ANC sequences. HLA-B15 and -62 restriction was inferred based on 2 different subjects possessing appropriate HLA class I allele and prior publication.

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

Epitope IVRMYSPTSILDIRQ
Immunogen HIV-1 infection
Species (MHC) human (A2, A24)
Donor MHC A2, A24, B15, B40; A11, A2, B44, B60; A2, A31, B27, B44
Country Australia
Assay type proliferation, CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Dyer *et al.* 2008

- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.

- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- Peptide 69 (NIH ARRP Cat# 7940), IVRMYSPTSILDIRQ, contains epitopes restricted by HLA-A2 and -A24 in one patient and HLA-A2 in different patients. This peptide elicited the following CTL responses: (1) 22+ years in a living non-progressor (2) >200 sfc/million PBMC for 12+ years in a former non-progressor who succumbed to a non-AIDS death (3) > 200 sfc/million PBMC for 22+ years in a former non-progressor who succumbed to loss of viremic control.

Species (MHC) mouse
Assay type CD8 T-cell Elispot - IFNγ, CD4 T-cell Elispot - IFNγ, Th support of CTL response, Chromium-release assay
Keywords vaccine-induced epitopes, Th1, Th2
References Gavioli *et al.* 2008

- It was demonstrated that co-immunization with Tat broadens in vivo epitope-specific CD8 and CD4 responses to heterologous proteins and thus can be considered as an adjuvant. Specifically, mice immunized with Gag and Tat, responded to 11 T cell Gag epitopes, 5 more than those detected in mice vaccinated with Gag alone. Mice immunized with Env and Tat, responded to 17 T cell Env epitopes, 12 more than those detected in mice vaccinated with Env alone.
- Co-immunization with Tat specificaly drove Th1 responses and did not affect Th2 responses.
- Both Th1 and Th2 responses against Tat were no significantly affected by co-immunization with Env.
- This epitope was recognized by mice co-immunized with Gag and Tat, but not by mice immunized with Gag alone.

HXB2 Location p24 (141–155)
Author Location Gag (273–287)
Epitope `IVRMYSPTSILDIRQ`
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Bailey *et al.* 2008

- This is the first documentation of transmission of HIV-1 from a patient who developed AIDS (Progressor) to an Elite Suppresssor (ES).
- Both patients are HLA-B*5703-positive. The ES also has B*27 allele. Escape mutations in HLA-B*57-restricted epitopes were present in both patients, suggesting that they by themselves cannot explain the difference in the outcomes.
- The study concluded that viral replication is controlled in ES by at least two mechanisms: (i) direct inhibition of viral replication by polyfunctional HIV-1 specific CD8+ T cells that proliferate in response to autologous viral peptides; (ii) selection for and maintenance of escape mutations that have a negative impact on viral fitness.
- This epitope elicited IFN-γ response in the Progressor. Both patients had R286K substitution.

Epitope RMYSPTSI
Epitope name RI8
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B*52)
Country Australia, Canada, Germany, United States
Keywords HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-B*52-associated substitution within optimally defined epitope RMYSPTSI is at positions T6, RMYSPtSI.

Country United States
Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric T-cell cytokine assay
Keywords escape, optimal epitope
References Koibuchi *et al.* 2005

- HIV-1-specific CD8 T-cell responses were persistent in the chronic phase of HIV-1 infection, although the responses to some of the epitopes declined despite the persistence of the targeted sequences in vivo. Only 4/14 epitopes were potential CTL escape variants, although strong responses to these epitopes persisted for 6 years. This indicates limited viral evolution within targeted CD8 T-cell epitopes during the chronic phase of infection.

- A form of this epitope that elicited a diminished Elispot response, RMYSPvSI, dominated the viral sequence for several years, and then reverted back to the B consensus form, RMYSPTSI.

References Zhao *et al.* 2007

- 46 ART-naive subjects with HIV-B infection were used to study CTL cross-responses between HIV clade B and C peptide sequences. 204/826 overlapping peptide epitopes tested were common between both clades in eliciting CTL responses that were of similar magnitude and frequency in both HIV-B and -C. Higher magnitudes and frequencies of responses were detected with peptides from Gag, Pol, Env and Nef proteins, while peptides from Rev, Vif, Vpu, Vpr and Tat were recognized less often.
- 27 peptides from immunodominant regions of higher inter-clade homology in Gag, Nef, Pol, Vpr, Env and Vif were found to be common between both clades in eliciting the greatest CTL responses. Although these 27 peptides differed by up to 39% between clades, CTL responsiveness was not affected.
- Cross-recognized peptides had a lower entropy of recognition than clade-B specific variants, suggesting that published conserved clade-B sequences are also more conserved between clades. Consensus sequences therefore occurred in virus regions of low intra-clade entropy and high inter-clade homology.
- 18/27 highly immunogenic clusters were previously reported by Frahm et al. [J. Virol. 78:2187-2200 (2004)].
- This peptide, GPKEPFRDYVDRFyKTLR differs from the consensus C sequence GPKEPFRDYVDRFfKTLR at 1 amino acid position, i.e. by 5.6%.

Epitope `GPKEPFRDYVDRFYKTLR`
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country Barbados, Haiti, United States
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords binding affinity, immunodominance
References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, GPKEPFRDYVDRFYKTLR, had an overall frequency of recognition of 16.7% - 18.6% AA, 11.5% C, 15.9% H, 14.3% WI. This peptide is included in a 43 aa Gag-p24 highly reactive region to be used for vaccine design.

Species (MHC) mouse (H-2L^{d})
Assay type Cytokine production, Chromium-release assay
Keywords epitope processing, vaccine-specific epitope characteristics, immunodominance
References Wild *et al.* 2004

- A codon optimized gag DNA vaccine was compared to a myristylation defective gag and p24 alone, both of which lack signals for secretion from transfected cells. Gag-derived immunogens that were secreted as VLPs and those that remained intracellular (p24) each produced strong CTL responses, and neither the size of antigen nor cellular trafficking and localization significantly influenced the strength of humoral and cellular immune activation. The formation and release of VLPs was not essential for eliciting strong CTL. BALB/c mice were given the DNA vaccine by i.m. administration of plasmid DNA for the prime and boost.
- Minigenes were made incorporating just 1 epitope, minitopes, carrying 1 of 3 murine class I epitopes linked to the Ad2-E3 protein-derived signal peptide to allow access of the epitope to the ER. Weak induction of cellular immune responses was observed, in contrast to the complex polyprotein. The E10F minigene did not produce a detectable CTL response.

References Rolland *et al.* 2007b

- Resemblance between viral and host peptides may preclude immune reactivity against such epitopes. This was shown using ELISpot to test recognition against the entire viral genome in 314 HIV-infected subjects. Also, 944 overlapping Nef variants were tested for 30 patients. This inverse relationship between similarity of HIV epitope to host proteome and its immunogenicity has implications in vaccine design.
- Other factors, however, like entropy effects and forbidden residue usage or even hydrophobicity or disorder prediction scores were more influential than this similarity to self, with regards to immunogenicity of HIV-1. Also, forbidden aa ratios at the C-terminus of CTL epitopes and similarity to host proteins are positively correlated. Low disorder peptides elicit broader CTL responses and are better recognized.
- This HIV-1 epitope, EPFRDYVDRF, is similar to human protein COPINE 5, sequence vPFRDYVDR.

References Geldmacher *et al.* 2007a

- 56 ART-naive subjects were studied to assess whether T-cell responses to Gag and Nef are biased towards infecting subtype recognition, in a setting of epidemic consisting of subtypes A,C and D and their recombinant forms. The infecting subtype was determined by multi-region hybridization assay. Overlapping 15-mer isolate-based Gag and Nef peptide sets representative of local subtypes were used. The best recognized epitope variant in terms of magnitude and breadth corresponded to infecting subtype, in this case usually type-C. Hot spots of CTL recognition in Gag were in p24, p17 and p15; hotspots against Nef were in its central, conserved region.
- Epitope variants EPFRDYVDRFf and EPFRDYVDRFy were studied as peptide sequences PK-EPFRDYVDRFf-KT (subtypes C and A) and PK-EPFRDYVDRFy-KT (subtype D) with 12.5% responders. Subtypes C and A were best recognized. Associated HLA frequently expressed within the studied cohort is listed in the study as B81.

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

References Liu *et al.* 2006b

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.

Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (B18)
Keywords HIV exposed persistently seronegative (HEPS)
References Kaul *et al.* 2001a

- Variants FRDYVDRF(Y/F)K are specific for the B,D/A,C clades.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B18 women, 3/4 HEPS and 1/9 HIV-1 infected women recognized this epitope, likelihood ratio 5.3, p value 0.04, and HEPS women tended to respond to FRDYVDRFY/FK, while infected women tended to respond to YPLTFGWCY/F.
- The dominant response to this HLA allele was to this epitope for all 3/4 HEPS cases and for the single HIV-1 infected women that responded to this epitope.
- Four epitopes were considered to be "resistant epitopes", as they were preferentially reactive in HEPS women and so may confer resistance, and these were found in three different proteins: A2 ILK(D/E)PVHGV in RT, A*6802 DTVLEDINL in Protease, B14 DLNM/TLN(I/V)V in p24 and B18 FRDYVDRF(Y/F)K also in p24.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.

CTL CD8+

- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.
- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- Peptide 74 (NIH ARRP Cat# 7945), FRDYVDRFYKTLRAE, contains an epitope restricted by HLA-B44 in different patients and elicited the following CTL responses: (1) 22+ years in a living non-progressor (2) for 12+ years in a former non-progressor who succumbed to a non-AIDS death (3) up to 15+ years in a former non-progressor who succumbed to loss of viremic control.

References Barugahare *et al.* 2005

- T-cell immune responses were examined in HIV-1 infected Ugandans. Similar levels of cross-clade responses for Gag, Env and Nef were observed. Higher frequencies of responses in conserved regions were found for Gag within a single clade, while areas with higher viral sequence variation had fewer detectable responses. Differential interclade sequence homologies between the Gag regions did not affect the respective level of cross-clade recognition.
- The sequence contains a known epitope (FRDYVDRFYKTL), but the subject recognizing it does not carry HLAs of the previously-defined restriction. The isolated viral sequence was frdyvdrfykVlrae, from the patient that could recognize the peptide.

Keywords rate of progression
References Bailey *et al.* 2008

- This is the first documentation of transmission of HIV-1 from a patient who developed AIDS (Progressor) to an Elite Suppresssor (ES).
- Both patients are HLA-B*5703-positive. The ES also has B*27 allele. Escape mutations in HLA-B*57-restricted epitopes were present in both patients, suggesting that they by themselves cannot explain the difference in the outcomes.
- The study concluded that viral replication is controlled in ES by at least two mechanisms: (i) direct inhibition of viral replication by polyfunctional HIV-1 specific CD8+ T cells that proliferate in response to autologous viral peptides; (ii) selection for and maintenance of escape mutations that have a negative impact on viral fitness.
- This epitope elicited IFN-γ response in the ES and the Progressor.

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-A24 women, 0/4 HEPS and 6/10 HIV-1 infected women recognized this epitope, likelihood ratio 7.2, p value 0.03, and (R)YL(R/K)DQQLL tended to be reactive in HEPS and infected women, RDYVDRFFKTL in infected women only.
- The dominant response to this HLA allele was to this epitope in all of the 6/10 HIV-1 infected women.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.
- Subject ML 1707 started with a CTL response to A*6802 DTVLEDINL prior to seroconversion, and switched to A*6802 ETAYFILKL and A24 RDYVDRFFKTL post-seroconversion.

CTL CD8+

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

- CD8+ T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2-39) epitopic regions were targeted in an average of 6 proteins (range, 1-8). HAART resulted in decrease in antigen and reduction in gamma IFN EliSpot responses, suggesting active responses to autologous virus. The lack of mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN-based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- 1 subject recognized this epitope with low functional avidity. The autologous sequence matched the B consensus.

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape,within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape muations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

- To compare HIV-1 and HIV-2 CTL responses to Gag as far as homologous levels of response and cross-reactivity, 12 consecutive Gag OLP pools were used with cells from 17 HIV-1 and 17 HIV-2 patients in enhanced IFN-gamma ELISpot assays. Gag-specific homologous CTL responses were significantly higher in HIV-2 patients, but cross-reactivity in HIV-1-infected patients was broader and stronger.
- Cross-reactivity correlated with sequence similarity in HIV-2 patients, but not HIV-1 patients. CD4+ T-cell counts of HIV-2-infected patients correlated directly with homologous responses and inversely with cross-reactive responses; this was not true of HIV-1-infected subjects.
- The authors favor a model in which high HIV-2-specific CTL responses control its replication, containing immune evasion and thus limiting the possibility of cross-reaction to HIV-1 homologous epitopes.
- HIV-1 Gag epitope DYVDRFFKTL is probably cross-recognized with its homologous HIV-2 epitope, SYVDRFYKSL.

- HLA-A*3303 is a common HLA allele in east and southeast Asia. Pol, Gag and Nef SF2 proteins were scanned for potential A*3303 epitopes. 99 potential epitopes were synthesized, and 52/99 bound to A*3303. Six of these served as peptide-targets for lysis by PBMC from infected individual, and clones derived from 4 of these 6 could lyse HIV-vaccinia infected target cells, indicating proper processing.
- This epitope is one of the 2/6 peptides that could induce CTL responses in the PBMC of infected individuals, but was not properly processed in a vaccinia-HIV infected target cell.

- HLA-A11-restricted CTL epitopes in 2 male Han Chinese subjects (one ART naive and one receiving HAART) were determined. A novel epitope was discovered and 5 other putative epitopes confirmed using 425 overlapping peptides spanning the entire HIV-1 clade B proteome. By employing intracellular cytokine staining, the authors developed a new method of mapping optimal epitopes and defining their HLA restriction efficiently. In spite of its being the most common HLA type in China, A*11-restricted epitopes were recognized less frequently than other epitopes, and A*11-restricted responses formed a mean of only 13% of the responses against HIV.
- This epitope, YVDRFYKTL, was detected within overlapping peptides SILDIRQGPKEPFRDYV and GPKEPFRDYVDRFYKTLR.

- 25 CTL epitopes with sequence conservation were studied. Population protection coverage (PPC) for 5 different ethnic groups in the US was estimated by combining HLA binding predictions and known HLA frequencies. HIV-1-naive individuals mounted a better response to the epitope pools than HIV-1 infected individuals.
- A more detailed evaluation of HIV-naive T-cell responses was undertaken, limiting the study to only those peptides that are restricted to A*0201. Though the peptides could cross-recognize and bind different HLA, they were able to specifically lyse only cells of the same (A*0201) HLA-restriction. Thus, the CTL response was less degenerate than peptide binding to MHC.
- In addition to the published restriction above, epitope YVDRFFKTL was predicted to be restricted by HLA A*0203, A*0204, A*0207, A*2601 and B*3801.

- 56 ART-naive subjects were studied to assess whether T-cell responses to Gag and Nef are biased towards infecting subtype recognition, in a setting of epidemic consisting of subtypes A,C and D and their recombinant forms. The infecting subtype was determined by multi-region hybridization assay. Overlapping 15-mer isolate-based Gag and Nef peptide sets representative of local subtypes were used. The best recognized epitope variant in terms of magnitude and breadth corresponded to infecting subtype, in this case usually type-C. Hot spots of CTL recognition in Gag were in p24, p17 and p15; hotspots against Nef were in its central, conserved region.
- Epitope variants YVDRFfKTL and YVDRFyKTL (HLA-B*1503) were studied as peptide sequences FRD-YVDRFfKTL-RAE (subtypes C and A) and FRD-YVDRFyKTL-RAE (subtype D), with 30% responders. Subtypes C and A sequences were recognized best. Associated HLA frequently expressed within the studied cohort is listed in the study as B*1510.

Epitope YVDRFFKTL
Epitope name B15-YL9(p24)
Immunogen HIV-1 infection
Species (MHC) human (B15)
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, early-expressed proteins
References Altfeld *et al.* 2006

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

Keywords characterizing CD8+ T cells
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was one of two used to illustrate how specific epitopes were characterized with regard to defining the optimal epitope and the HLA restricting element. HLA allelic associations in the population with peptide recognition was highly predictive of the epitope within the 15 mer.

Country United States, South Africa
Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding
Keywords memory cells
References Wherry *et al.* 2006

- Cohorts of HIV-infected subjects from the US and South Africa were screened for CD8+ EliSpot responses. Tetramer assays were performed for 13 frequently targeted HIV epitopes and compared to Flu, vaccinia, and EBV epitopes assayed in non-HIV-infected subjects. HIV tetramer+ CD8 T cells expressed less CD127, and this reduction was pervasive across all epitopes and alleles tested. These results indicated impaired HIV-specific memory CD8 T cell differentiation, regardless of level of control of viremia, epitopes targeted, or HLA alleles.

References Zhao *et al.* 2007

- 46 ART-naive subjects with HIV-B infection were used to study CTL cross-responses between HIV clade B and C peptide sequences. 204/826 overlapping peptide epitopes tested were common between both clades in eliciting CTL responses that were of similar magnitude and frequency in both HIV-B and -C. Higher magnitudes and frequencies of responses were detected with peptides from Gag, Pol, Env and Nef proteins, while peptides from Rev, Vif, Vpu, Vpr and Tat were recognized less often.
- 27 peptides from immunodominant regions of higher interclade homology in Gag, Nef, Pol, Vpr, Env and Vif were found to be common between both clades in eliciting the greatest CTL responses. Although these 27 peptides differed by up to 39% between clades, CTL responsiveness was not affected.
- Cross-recognized peptides had a lower entropy of recognition than clade-B specific variants, suggesting that published conserved clade-B sequences are also more conserved between clades. Consensus sequences therefore occurred in virus regions of low intra-clade entropy and high inter-clade homology.
- 18/27 highly immunogenic clusters were previously reported by Frahm et al. [J. Virol. 78:2187-2200 (2004)].
- This peptide, YVDRFyKTLRAEQAsQeV differs from the consensus C sequence YVDRFfKTLRAEQAtQdV at 3 amino acid positions, i.e. by 16.7%.

References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, YVDRFYKTLRAEQASQEV, had an overall frequency of recognition of 25.3% - 22% AA, 30.8% C, 31.8% H, 14.3% WI. This peptide is included in a 43 aa Gag-p24 highly reactive region to be used for vaccine design.

References Leligdowicz *et al.* 2007

- To find the factors involved in attenuated disease course and long term non-progression, HIV-2 and immune control were studied. HIV-2 viral load was used as a predictor of patient survival. HIV-2 viral load correlated inversely with magnitude of IFN-gamma response, relative dominance of Gag-specific peptides' responses over other proteins' responses, and the breadth of different peptide-specific immune responses. The most frequently recognized peptides were in Gag protein, followed by Env and Pol, while Nef and accessory proteins (Vif, Vpx, Vpr, Tat and Rev) rarely elicited responses. The 6 most recognized peptides were clustered in a highly conserved region of Gag.
- This peptide, YVDRFYKSLRAEQTDPAV, was most frequently recognized at 20 out of 65 different subjects. Its responses can be both CD8 and CD4 T cell restricted.

Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 19% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Assay type CD8 T-cell Elispot - IFNγ
Keywords binding affinity, subtype comparisons, acute/early infection
References Malhotra *et al.* 2007b

- T-cell responses to clade B Gag peptides were tested using sequences based on consensus (CON), most recent common ancestor (ANC) and center of tree (COT); as well as CON sequences from clade A, clade C and M-group Gag. It was found that Gag-specific cross-clade T-cell IFN-gamma responses are detectable during primary infection, and there was no significant difference in breadth or magnitude of responses with the different peptide sets. While several epitopes in low diversity domains are invariant across clades, other recognized variants are seen outside HLA anchor positions. T-cell immunity often tolerates conservative or semi-conservative amino acid substitutions but changes presumed to be in TCR contact sites may abrogate epitope recognition.

- Epitope sequences for this eptiope, VS14 are invariant between CON B, COT B, ANC B and M-group. Cross-recognition is seen to both A- and C-clade variants. An anchor residue is at position 9; while both A- and C- variants contain a change at position 14 to VDRFYKLTRAEQAt.
- Probable HLA restriction for this epitope was suggested to be HLA A33 based on the subject possessing the appropriate HLA class I allele.

References Reche *et al.* 2006

- 25 CTL epitopes with sequence conservation were studied. Population protection coverage (PPC) for 5 different ethnic groups in the US was estimated by combining HLA binding predictions and known HLA frequencies. HIV-1-naive individuals mounted a better response to the epitope pools than HIV-1 infected individuals.
- A more detailed evaluation of HIV-naive T-cell responses was undertaken, limiting the study to only those peptides that are restricted to A*0201. Though the peptides could cross-recognize and bind different HLA, they were able to specifically lyse only cells of the same (A*0201) HLA-restriction. Thus, the CTL response was less degenerate than peptide binding to MHC.
- In addition to the published restriction above, epitope DRFFKTLRA was predicted to be restricted by HLA B*1402, B*2701, B*2702, B*2703, B*2704, B*2705 and B*2709.

Epitope DRFFKTLRA
Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (B14)
Keywords HIV exposed persistently seronegative (HEPS)
References Kaul *et al.* 2001a

- Variants DRF(F/W)KTLRA are specific for clades A/B.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B14 women, 0/4 HEPS and 6/7 HIV-1 infected women recognized this epitope, likelihood ratio 14.4, p value 0.004 and HEPS women tended to respond to DLNMMLNIV/DLNTMLNVV, while infected women tended to respond to DRF(F/W)KTLRA.
- The dominant response to this HLA allele was to this epitope for all of the 6/7 HIV-1 infected women.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.

Assay type CD8 T-cell Elispot - IFNγ
Keywords acute/early infection, early-expressed proteins
References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- This epitope was recognized in two subjects early in infection, presented by B14 in each case.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

CTL CD8+

- Killing efficiency of CTLs and their ability to suppress viral replication is shown to depend more on epitope specificity than to antigenic avidity. Different clones recognizing the same epitope had similar killing efficiency despite their variation in avidity. Nef specific CTL clones tended to be most inhibitory, followed by Gag, then by RT specific clones, regardless of avidity.
- 1/14 CTL T-cell clones tested were specific for Gag/p24-DA9. Under conditions of excess peptide (100ug/ml), there was no difference in their lytic potential; all possessed similar effector capacity. Avidity was measured as the sensitizing dose of peptide required for 50% of maximal killing (SD50), which varied from 20 pg/ml to 100 ng/ml, over four orders of magnitude for all 14 epitopes. The SD50 value for Gag/p24-DA9 was 100,000 pg/ml, it had the lowest avidity of the 14 tested.

Assay type CD8 T-cell Elispot - IFNγ
Keywords characterizing CD8+ T cells
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Assay type CD8 T-cell Elispot - IFNγ
Keywords binding affinity, subtype comparisons, acute/early infection
References Malhotra *et al.* 2007b

- T-cell responses to clade B Gag peptides were tested using sequences based on consensus (CON), most recent common ancestor (ANC) and center of tree (COT); as well as CON sequences from clade A, clade C and M-group Gag. It was found that Gag-specific cross-clade T-cell IFN-gamma responses are detectable during primary infection, and there was no significant difference in breadth or magnitude of responses with the different peptide sets. While several epitopes in low diversity domains are invariant across clades, other recognized variants are seen outside HLA anchor positions. T-cell immunity often tolerates conservative or semi-conservative amino acid substitutions but changes presumed to be in TCR contact sites may abrogate epitope recognition.
- Epitope sequences for this eptiope, DA9 are invariant between CON B, COT B, ANC B and M-group. Cross-recognition is seen to both A- and C-clade variants. An anchor residue is at position 2; while both A- and C- variants contain a change at position 4 to DRFfKLTRA. HLA-B14 restriction was inferred based on 2 subjects possessing appropriate HLA class I allele and prior publication.

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape,within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient BORI had high viral loads and rapid CD4 decline. BORI mounted 8 detected responses. BORI did not control viral replication well, and escape mutations occurred early and in most epitopes, 6/7 that were precisely identified.
- DRFYKTLRAEQ didn't vary. There was no response in acute infection to this epitope, but the response was detectable by early infection.

Assay type CD8 T-cell Elispot - IFNγ, CD4 T-cell Elispot - IFNγ, Th support of CTL response, Chromium-release assay
Keywords vaccine-induced epitopes, Th1, Th2
References Gavioli *et al.* 2008

- It was demonstrated that co-immunization with Tat broadens in vivo epitope-specific CD8 and CD4 responses to heterologous proteins and thus can be considered as an adjuvant. Specifically, mice immunized with Gag and Tat, responded to 11 T cell Gag epitopes, 5 more than those detected in mice vaccinated with Gag alone. Mice immunized with Env and Tat, responded to 17 T cell Env epitopes, 12 more than those detected in mice vaccinated with Env alone.
- Co-immunization with Tat specificaly drove Th1 responses and did not affect Th2 responses.
- Both Th1 and Th2 responses against Tat were no significantly affected by co-immunization with Env.
- This epitope was recognized both by mice co-immunized with Gag and Tat, and by mice immunized with Gag alone.

Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Bailey *et al.* 2008

- This is the first documentation of transmission of HIV-1 from a patient who developed AIDS (Progressor) to an Elite Suppresssor (ES).
- Both patients are HLA-B*5703-positive. The ES also has B*27 allele. Escape mutations in HLA-B*57-restricted epitopes were present in both patients, suggesting that they by themselves cannot explain the difference in the outcomes.
- The study concluded that viral replication is controlled in ES by at least two mechanisms: (i) direct inhibition of viral replication by polyfunctional HIV-1 specific CD8+ T cells that proliferate in response to autologous viral peptides; (ii) selection for and maintenance of escape mutations that have a negative impact on viral fitness.
- This epitope elicited IFN-γ response in the ES.

Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- Responses to this peptide were detected in 17% of the study subjects, and it was one of the 25 most frequently recognized peptides.

References Zhao *et al.* 2007

- 46 ART-naive subjects with HIV-B infection were used to study CTL cross-responses between HIV clade B and C peptide sequences. 204/826 overlapping peptide epitopes tested were common between both clades in eliciting CTL responses that were of similar magnitude and frequency in both HIV-B and -C. Higher magnitudes and frequencies of responses were detected with peptides from Gag, Pol, Env and Nef proteins, while peptides from Rev, Vif, Vpu, Vpr and Tat were recognized less often.
- 27 peptides from immunodominant regions of higher interclade homology in Gag, Nef, Pol, Vpr, Env and Vif were found to be common between both clades in eliciting the greatest CTL responses. Although these 27 peptides differed by up to 39% between clades, CTL responsiveness was not affected.
- Cross-recognized peptides had a lower entropy of recognition than clade-B specific variants, suggesting that published conserved clade-B sequences are also more conserved between clades. Consensus sequences therefore occurred in virus regions of low intra-clade entropy and high inter-clade homology.
- 18/27 highly immunogenic clusters were previously reported by Frahm et al. [J. Virol. 78:2187-2200 (2004)].
- This peptide, LRAEQAsQeVKNWMTeTL differs from the consensus C sequence LRAEQAtQdVKNWMTdTL at 3 amino acid positions, i.e. by 16.7%.

References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, LRAEQASQEVKNWMTETL, had an overall frequency of recognition of 22.7% - 20.3% AA, 46.2% C, 18.2% H, 9.5% WI. This peptide is included in a 43 aa Gag-p24 highly reactive region to be used for vaccine design.

References Leligdowicz *et al.* 2007

- To find the factors involved in attenuated disease course and long term non-progression, HIV-2 and immune control were studied. HIV-2 viral load was used as a predictor of patient survival. HIV-2 viral load correlated inversely with magnitude of IFN-gamma response, relative dominance of Gag-specific peptides' responses over other proteins' responses, and the breadth of different peptide-specific immune responses. The most frequently recognized peptides were in Gag protein, followed by Env and Pol, while Nef and accessory proteins (Vif,

CTL CD8+

Vpx, Vpr, Tat and Rev) rarely elicited responses. The 6 most recognized peptides were clustered in a highly conserved region of Gag.
- This peptide, LRAEQTDPAVKNWMTQTL, was recognized by 11 out of 65 subjects. It is found in the 149 amino-acid long HIV-2 proteome region of Gag 175-323.

Keywords dynamics, acute/early infection, characterizing CD8+ T cells
References Jones *et al.* 2004
- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape,within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape muations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

References Koibuchi *et al.* 2005

- HIV-1-specific CD8 T-cell responses were persistent in the chronic phase of HIV-1 infection, although the responses to some of the epitopes declined despite the persistence of the targeted sequences in vivo. Only 4/14 epitopes were potential CTL escape variants, although strong responses to these epitopes persisted for 6 years. This indicates limited viral evolution within targeted CD8 T-cell epitopes during the chronic phase of infection.
- Elispot responses to the consensus form of this epitope, RAEQASQEV, were much more intense than to the most common variants of the epitope found over time in this individual, RAEQAStEV and RAEQASQdV. There was a diminished response to RAEQAStEV and no response to RAEQASQdV, so these appear to be escape variants. The strong response to the consensus form persisted, despite the fact it was not observed among the autologous sequences until it surfaced as a minor variant (5/13 sequences) after 6 years of chronic infection.

Epitope name G3
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B44)
Keywords HAART, ART
References Mollet *et al.* 2000

- A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFNgamma production to measure responses.

- In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished.
- Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.

Immunogen HIV-1 infection
Species (MHC) human (B44)
Donor MHC A32, B44
Keywords HAART, ART, supervised treatment interruptions (STI)
References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (`http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html`) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient B displayed the greatest response to epitope B44-AW11(p24) and also responded to A32-PW10(RT) in both PB and LN samples, while a third response against epitope A32-RW10(gp120) was only detected in the LN sample.

Country United States
Assay type CD8 T-cell Elispot - IFNγ
Keywords variant cross-recognition or cross-neutralization
References Draenert *et al.* 2004c

- CD8+ T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2-39) epitopic regions were targeted in an average of 6 proteins (range, 1-8). HAART resulted in decrease in antigen and reduction in gamma IFN EliSpot responses, suggesting active responses to autologous virus. The lack of mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN-based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- 1 subject recognized this epitope with low functional avidity. The autologous sequence matched the B consensus.

Keywords subtype comparisons, variant cross-recognition or cross-neutralization
References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype D Gag. The autologous epitope sequence had an D7E change, AEQASQeVKNW.

HXB2 Location p24 (174–184)

Immunogen HIV-1 infection
Species (MHC) human (B44)
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, early-expressed proteins
References Altfeld *et al.* 2006

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

CTL CD8+

- CTL responses were tested for both HIV-1 and EBV derived epitopes restricted by HLA-A, -B and -C alleles. HLA-B alleles more frequently induce detectable responses and that the responses are generally of greater magnitude than those for HLA-A and -C alleles.
- The magnitude and frequency of CTL recognition were related to each other and that TCR avidity for HLA/peptide complexes is a more important determinant for magnitude of response than peptide binding affinity to HLA.
- EBV response patterns were not significantly altered by HIV coinfection.
- Epitope AEQASQDVKNW elicited a magnitude of response of 525 SFC with a functional avidity of 0.5nM.

Keywords characterizing CD8+ T cells
References Streeck *et al.* 2008a

- T-cells were studied for exhaustion and dysfunction in chronic HIV infection. Polyfunctionality of CTL immune response to HIV-1 decreased with persistence of antigen presence over time in chronic infection. CTL exhaustion can thus be halted by reduction in viral antigen load - either by ART or through escape mutations.
- PD-1, marker for activation and apoptosis increases over time, but it decreases when epitope mutations develop. CD127 however, is not impacted by viral escape.
- No variation was found in epitope AEQASQDVKNW in an untreated patient. Previously published HLA-restriction for AW11 is HLA-B44.

References Turnbull *et al.* 2006

- Functional cross-reactivity of CD8 responses to HIV-1 epitopes restricted by different HLA-alleles was analyzed. It was shown that epitope-specific responses with the most efficient cross-recognition were strongly associated with delayed disease progression. Variant-cross recognition efficiency was linked to the dominant TCRs used for epitope recognition. Epitopes restricted by the same HLA-allele did not show similar variant cross-recognition efficiency, suggesting that the rate of disease progression might be associated with the quality of responses to certain critical epitopes.
- This epitope, B57-QAS, that is very strongly associated with delayed progression to AIDS, and its alanine-substituted variants are weakly cross-recognized.

CTL CD8+

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

References Buseyne *et al.* 2001

- Exogenous presentation or cross-presentation of epitopes by antigen presenting cells (APC) without protein synthesis is an alternative pathway for CTL epitope processing that may be important in the initial generation of viral specific CTL.
- Dendritic cells treated with AZT to inhibit protein synthesis were able to elicit a strong specific CTL response in QASQEVKNW specific CTL clone 141 without protein synthesis, while macrophages demonstrated a decreased presentation efficiency.
- Exogenous Gag epitope presentation was Env-dependent and required receptor-dependent fusion.

Epitope QATQEVKNW
Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (B53)
Keywords HIV exposed persistently seronegative (HEPS)
References Kaul *et al.* 2001a

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.

CTL CD8+

- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B53 women, 1/2 HEPS and 7/9 HIV-1 infected women recognized this epitope.

Epitope QATQEVKNM
Subtype A
Immunogen HIV-1 infection
Species (MHC) human (B53)
Keywords binding affinity, subtype comparisons
References Dorrell *et al.* 2001

- In clade A infected Gambians, three HLA-B53 epitopes were defined in Gag p24 using ELISPOT, tetramer, and cytotoxicity assays.
- Two of the new epitopes lacked the predicted P2 anchors, DTINEEAAEW and QATQEVKNM, and bound to B53 with high affinity, thus extending the anchor residue motif for B53 and the related B35.
- While S, T, and P could all fit into the HLA-B35 or HLA-B53 B pocket and form a hydrogen bond, A would not form a bond, so the authors propose compensatory interactions account for the high affinity of QATQEVKNM for B53.
- QATQEVKNM was recognized in 6/7 HLA-B53 subjects.
- Cross-recognition of QATQEVKNM was not studied here, but it was noted that both the A, QATQEVKNM, and B, QASQDVKNW, subtype version of this epitope, are also presented by HLA-B57 and B58, common HLA alleles in Africans.

Immunogen HIV-1 infection
Species (MHC) human (B53)
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, early-expressed proteins
References Altfeld *et al.* 2006

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

Epitope QASQEVKNW
Immunogen HIV-1 infection
Species (MHC) human (B53, B57, Cw04)
Assay type CD8 T-cell Elispot - IFNγ, HLA binding
Keywords binding affinity, immunodominance, optimal epitope
References Bihl *et al.* 2006

- CTL responses were tested for both HIV-1 and EBV derived epitopes restricted by HLA-A, -B and -C alleles. HLA-B alleles more frequently induce detectable responses and that the responses are generally of greater magnitude than those for HLA-A and -C alleles.
- The magnitude and frequency of CTL recognition were related to each other and that TCR avidity for HLA/peptide complexes is a more important determinant for magnitude of response than peptide binding affinity to HLA.
- EBV response patterns were not significantly altered by HIV coinfection.
- Epitope QASQEVKNW when restricted by HLA-B53, elicited a magnitude of response of 595 SFC with a functional avidity of 0.1nM and binding affinity of 9.7nM. When restricted by HLA-B57, it elicited a magnitude of response of 350 SFC with a functional avidity of 10nM and binding affinity of 157nM. When restricted by HLA-Cw04, it elicited a magnitude of response of 755 SFC with a functional avidity of 0.05nM.

Assay type CD8 T-cell Elispot - IFNγ
Keywords variant cross-recognition or cross-neutralization
References Draenert *et al.* 2004c
- CD8+ T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2-39) epitopic regions were targeted in an average of 6 proteins (range, 1-8). HAART resulted in decrease in antigen and reduction in gamma IFN EliSpot responses, suggesting active responses to autologous virus. The lack of mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN-based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- 2 subjects recognized this epitope with high functional avidity. Autologous sequence revealed no substitutions in this epitope compared to the B consensus.

Keywords responses in children, mother-to-infant transmission
References Feeney *et al.* 2005

- Escape mutations in TW10 and other B57-restricted epitopes were shown to arise early in infants following perinatal infection. Some escape variants were likely to have been transmitted vertically, from HLA-B57/5801 positive HIV-1 infected mothers, while others arose during infancy in cases where the children inherited the B57/5801 allele paternally. In contrast to adults, the majority of children showed a robust response to the escape variants, suggesting that infants are able to mount functional immune responses and drive immune escape and that a developing immune system may exhibit greater plasticity in recognizing viral variants.

References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from two infected people carrying subtype D Gag. The epitope sequence in one person matched the peptide, in the other had an E5D change, QASQdVKNW.

References Beattie *et al.* 2004

- This study compared CD8+ T cell EliSpot reponses to 58 Gag peptides that were optimal epitopes, with responses to overlapping 15 mers that spanned Gag. When screening for HIV-1-specific CD8 T-cell responses from 49 HIV+ people, overlapping 15-mer peptide pools revealed several novel responses that would have been missed using predefined CD8 epitopes. However, the 15-mer pools often missed low-level responses to predefined epitopes, especially when the epitope was located centrally in the 15-mer peptide, and the overall level of response to the 15 mers was generally lower(mean 1.4 fivel fold dilutions lower, range 0-3).
- In one individual, a response to QASQEVKNW could be detected at a concentration of 0.2 ug/ml, while a response to RAEQASQEVKNWMTE required 25 ug/ml for detection.

References Jennes *et al.* 2008

- To compare HIV-1 and HIV-2 CTL responses to Gag as far as homologous levels of response and cross-reactivity, 12 consecutive Gag OLP pools were used with cells from 17 HIV-1 and 17 HIV-2 patients in enhanced IFN-gamma ELISpot assays. Gag-specific homologous CTL responses were significantly higher in HIV-2 patients, but cross-reactivity in HIV-1-infected patients was broader and stronger.
- Cross-reactivity correlated with sequence similarity in HIV-2 patients, but not HIV-1 patients. CD4+ T-cell counts of HIV-2-infected patients correlated directly with homologous responses and inversely with cross-reactive responses; this was not true of HIV-1-infected subjects.
- The authors favor a model in which high HIV-2-specific CTL responses control its replication, containing immune evasion and thus limiting the possibility of cross-reaction to HIV-1 homologous epitopes.
- Novel HIV-2 Gag epitope QTDPAVKNWM (HLA-B53-restriction suggested by comparison with variant QATQDVKNWM) is not cross-recognized with its homologous and previously described HIV-1 epitope, QATQDVKNWM.

References Liu *et al.* 2006a
- An SIV Gag DNA vaccine was studied in mice in order to enhance subdominant immune responses to the KV9 epitope, without compromising its immunodominant response to the Gag AL11 epitope. Both epitopes share a common MHC restricting allele. Novel vaccine strategies including anatomic separation and heterologous prime-boost were investigated to expand vaccine-elicited CTL responses. This was the first study of its kind using DNA gene-based vaccines.
- This immunodominant epitope, AAVKNWMTQTL (AL11), was omitted from the initial vaccination administered, rendering the mouse incapable of recognizing it or the mutated peptide AAVKaWMTQTL, and allowing instead a dramatic, sustained response to the subdominant epitope studied.
- The immunodomination of AL11 over the subdominant epitope (KV9) was found to be a local rather than systemic mechanism, depending on anatomic the site of vaccine administration.

- T-cell responses to clade B Gag peptides were tested using sequences based on consensus (CON), most recent common ancestor (ANC) and center of tree (COT); as well as CON sequences from clade A, clade C and M-group Gag. It was found that Gag-specific cross-clade T-cell IFN-gamma responses are detectable during primary infection, and there was no significant difference in breadth or magnitude of responses with the different peptide sets. While several epitopes in low diversity domains are invariant across clades, other recognized variants are seen outside HLA anchor positions. T-cell immunity often tolerates conservative or semi-conservative amino acid substitutions but changes presumed to be in TCR contact sites may abrogate epitope recognition.
- Epitope sequences for this eptiope, VV11 are invariant between CON B, COT B, ANC B and M-group. Cross-recognition is seen only to the A-clade variant. Anchor residues are at positions 2, 9 and 10; while the C-clade variant contains a semi-conservative change at position 7 to VKNWMTdTLLV.
- This epitope was suggested to be preented by HLA-B27, based on the subject possessing the appropriate HLA class I allele.

- It was demonstrated that co-immunization with Tat broadens in vivo epitope-specific CD8 and CD4 responses to heterologous proteins and thus can be considered as an adjuvant. Specifically, mice immunized with Gag and Tat, responded to 11 T cell Gag epitopes, 5 more than those detected in mice vaccinated with Gag alone. Mice immunized with Env and Tat, responded to 17 T cell Env epitopes, 12 more than those detected in mice vaccinated with Env alone.
- Co-immunization with Tat specificaly drove Th1 responses and did not affect Th2 responses.
- Both Th1 and Th2 responses against Tat were no significantly affected by co-immunization with Env.
- This epitope was recognized by mice co-immunized with Gag and Tat, but not by mice immunized with Gag alone.

Immunogen HIV-1 infection
Species (MHC) human (A11)
Country China
Assay type CD8 T-cell Elispot - IFNγ
References Gong *et al.* 2006

- CTL responses were studied in treated and untreated donors from China, using Gag peptides from Henan isolate. All peptides were predicted to have A2 or A11 restriction (two of the most prominent alleles in Chinese population) and HLA restriction was further analyzed by CTL recognition in patients carrying corresponding allele. Among treated donors, HLA-A2 donors had higher CTL response than than HLA-A11 donors. Chronically infected untreated individuals had higher magnitude of CTL response than treated ones.

Assay type Chromium-release assay
Keywords epitope processing, escape
References Yokomaku *et al.* 2004

- Epitope variants escaped from being killed by CTLs in an endogenous expression system although they were recognized when corresponding synthetic peptides were exogenously loaded onto the cells. Escape is thus probably due to changes that occur during the processing and the presentation of epitopes in infected cells.
- Epitope variant nSnpdckNi was not recognized when added exogenously or when processed endogenously, but the mutations were in anchor residues and presumably inhibited binding to B*5101.

Assay type CD8 T-cell Elispot - IFNγ
Keywords HAART, ART, supervised treatment interruptions (STI)
References Arnedo-Valero *et al.* 2004

- T cell immune responses following STI were monitored in two chronically HIV-1 infected partners (A and B) who had contracted HIV-1 during 1992. STI induced strong transitory CD4+ and CD8+ T cell responses in both patients. The viruses remained very closely related over 10 years, despite the two individuals having different HLA types; the authors suggest the maintained similarity does not support a strong role for HLA driven HIV diversity as has been claimed in Moore et al. (Science 2002).
- During the second treatment stop, patient A developed a strong proliferative response to p24, and multiple strong CD8+ T cell repsonses to Env, Pol, Gag and Nef. This patient was able to control viral load for two years follow up without therapy. Patient B developed a very weak CD4+ T cell response against p24 during breaks in therapy, and had CD8+ responses to two epitopes. Patient A: A01, A32, B*1410, B15; Patient B: A*3101, A68, B*4403, B51.

Assay type proliferation, CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Dyer *et al.* 2008

- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.
- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- Peptide 82 (NIH ARRP Cat# 7953), NANPDCKTILKALGP, contains an epitope restricted by HLA-B7 and elicited a CTL response in a living non-progressor for 22+ years at >100 sfc/million PBMC.

Keywords rate of progression, escape
References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses,and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0-80% as efficiently as the index peptide, and the relatively efficiency of the variant eptiopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This was one of 8 reactive epitopes found not to vary over time.

References Rolland *et al.* 2007b

- Resemblance between viral and host peptides may preclude immune reactivity against such epitopes. This was shown using ELISpot to test recognition against the entire viral genome in 314 HIV-infected subjects. Also, 944 overlapping Nef variants were tested for 30 patients. This inverse relationship between similarity of HIV epitope to host proteome and its immunogenicity has implications in vaccine design.
- Other factors, however, like entropy effects and forbidden residue usage or even hydrophobicity or disorder prediction scores were more influential than this similarity to self, with regards to immunogenicity of HIV-1. Also, forbidden aa ratios at the C-terminus of CTL epitopes and similarity to host proteins are positively correlated. Low disorder peptides elicit broader CTL responses and are better recognized.
- This HIV-1 epitope, PDCKTILKA, is similar to human protein Deltex 4 homolog, sequence HPDCKTI.

Country Australia, Canada, Germany, United States
Keywords HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-B*08-associated substitution within optimally defined epitope DCKTILKAL is at positions K3, DCkTILKAL. DL9 has a very low recognition frequency and does not escape.

Epitope DCKTILKAL
Epitope name DCK
Immunogen HIV-1 infection
Species (MHC) human (B8)
Keywords HAART, ART, supervised treatment interruptions (STI), immunodominance, acute/early infection
References Oxenius *et al.* 2000

- Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable.
- This epitope was recognized at a low level by only 1 of the 7/8 study subjects that were HLA B8.
- Patient SC12(HLA A1, B8/39, Cw0701/0702, DR2/3, DR51/52, DQ2/6) had sustained therapy started during acute infection and maintained an immunodominant response to FLKEKGGL throughout and minor responses to GEIYKRWII, DCKTILKAL, GGKKKYKLK – GEIYKRWII and GGKKKYKLK responses were stimulated by a brief period off therapy.

Assay type proliferation, Chromium-release assay, Flow cytometric T-cell cytokine assay
Keywords HAART, ART, memory cells, immune dysfunction
References Gamberg *et al.* 2004a

- HAART restores HIV specific immunity after advanced infection by increase of CD4+ and CD8+ T cell numbers after supression of viral replication. However, HIV specific CTLs emerged only with detectable viral replication breakthroughs and were short-lived while CD4+ T-cell responses remained compromised, suggesting failure of generating stable CD8+ memory T-cells in the absence of HIV-specific T-helper responses.

Epitope DCKTILKAL
Epitope name B8-DL9(p24)
Immunogen HIV-1 infection
Species (MHC) human (B8)
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, early-expressed proteins
References Altfeld *et al.* 2006

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

Epitope DCKTILKALGPAATL
Epitope name DL15
Immunogen HIV-1 infection
Species (MHC) human (B*57)
Assay type CD8 T-cell Elispot - IFNγ
Keywords escape
References Bailey *et al.* 2006b

- Impact of CTL escape mutations in HLA-B57 positive elite supressors was examined. Escape mutations in B57-restricted Gag epitopes were present in all viruses derived from plasma but were lacking in proviruses, suggesting a strong selective pressure acting upon virus in plasma. IFN-gamma responses were detected to both wild-type epitopes and mutant plasma virus epitopes. In some individuals, CD8 IL-2 secretion, rather than IFN-gamma responses, showed better correlation with the plasma viral variants.

- One subject responded to peptide DL15, a non-B*57-restricted peptide.

Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Bailey *et al.* 2008

- This is the first documentation of transmission of HIV-1 from a patient who developed AIDS (Progressor) to an Elite Suppresssor (ES).
- Both patients are HLA-B*5703-positive. The ES also has B*27 allele. Escape mutations in HLA-B*57-restricted epitopes were present in both patients, suggesting that they by themselves cannot explain the difference in the outcomes.
- The study concluded that viral replication is controlled in ES by at least two mechanisms: (i) direct inhibition of viral replication by polyfunctional HIV-1 specific CD8+ T cells that proliferate in response to autologous viral peptides; (ii) selection for and maintenance of escape mutations that have a negative impact on viral fitness.
- This epitope elicited IFN-γ response in the ES.

Keywords supervised treatment interruptions (STI), immunodominance, characterizing CD8+ T cells, drug resistance
References Daucher *et al.* 2008

- A detailed analysis of 6 chronically infected patients' CTL responses to autologous virus was performed after ART and SIT (structured interruption of therapy). Qualitative responses including degranulation and production of IFN-gamma, MIP-1beta, TNF-alpha, IL-2, but not memory CD27, CD45RO and CD57 T cells correlated with extended low plasma viremia. Frequency and breadth of CTL response as well as immune escape did not influence virological outcome.
- One patient exhibited drug resistance mutations K170R (to NNRTI efavirenz) and D76N, K70R (to NRTIs).
- Autologous epitopes were preferentially recognized over optimal, consensus sequences.
- Patients with favorable virological outcomes demonstrated CTL recognition within multiple, conserved regions of Gag and Nef.

- Patients with poor virological outcomes recognized optimal epitopes with much lower frequencies, though this was not significant.
- HLA-B15 and -Cw3-restricted epitope, KALGPAATL, elicited a response in 1 patient and is found in Gag immunodominant region DCKTILKALGPAATLE.

Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay
Keywords dynamics, acute/early infection, characterizing CD8+ T cells
References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape,within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape muations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

HXB2 Location p24 (203–211)
Author Location Gag
Epitope RALGPGATL/M
Subtype C
Immunogen HIV-1 infection
Species (MHC) human
Keywords HLA associated polymorphism
References Rousseau *et al.* 2008

- 3 phylogenetic correction methods—MLL (maximum likelihood character state analysis followed by likelihood ratio test), MLF (maximum likelihood character state analysis followed by Fisher test), and parsimony character state analysis were used to identify points in the HIV-1 subtype C proteome that conferred susceptibility or resistance to CTLs. Associations of HLA-epitope combinations that were inferred to be susceptible or resistant were organized into immunological sets that would help identify the best residues and genes as candidates for vaccines. While all proteins were interrogated, Gag, Pol, Env and Nef were focused upon. Amino acid changes were evaluated for association with plasma viral load.
- Proteome maps may be seen at `http://www.hiv.lanl.gov/content/immunology/hlatem/study5/index.html` with information showing single or multiple sites involving escape and reversion.
- HLA-B and -C alleles associated more with aa changes than HLA-A, suggesting that the former 2 are more important in driving viral evolution.
- The ratio of susceptible to resistant residues in HIV proteins was in descending order, Vpr>Gag>Rev>Pol>Nef>Vif>Tat>Env>Vpu, showing that epitopes from the earlier proteins are more conserved owing to viral fitness cost upon mutation.
- This Gag p24 HLA C*08-restricted epitope, RALGPGATL/M was susceptible at P5. Variants RALGaGATL/M, RALGqGATL/M, RALGsGATL/M, RALGtGATL/M and RALGvGATL/M were resistant to CTL response, but associated with lower viral loads. This epitope is 1 of 7 that suggest a fitness cost to immune escape.

Assay type proliferation, CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Dyer *et al.* 2008

- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.
- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- Peptide 85 (NIH ARRP Cat# 7956), LGPAATLEEMMTACQ, contains an epitope restricted by HLA-A2 in different patients and elicited the following CTL immune responses: (1) $\sim$50 sfc/million PBMC for 22+ years in a living non-progressor (2) for 22+ years in another living non-progressor.

Keywords rate of progression, immunodominance
References Geldmacher *et al.* 2007b

- The objectives of this study were to find antiviral epitopic determinants of Gag HIV-specific CTL response and to find 'host HLA-CTL response' correlations. By studying 56 ART-naive subjects including low viral load (LVL) responders, the authors show that subjects expressing the "protective" HLA-B*0702, -B*5801, and -B*8101 have broader Gag epitope recognition which may be abrogated if co-expressed with HLA-B alleles associated with rapid AIDS progression. Also, a negative linear relation was seen between Gag epitope numbers and plasma viral load while a positive relationship was seen with CD4 T-cell count. Finally, LVL subjects recognized specific Gag regions at the N- and C-termini of the protein more often than peptides in the middle of the protein.
- Epitope GPGATLEEM, whose presentation by HLA-B*8101 is inferred, is strongly associated with LVL. However, the second position GpGATLEEM is highly variable.

References Zhao *et al.* 2007

- 46 ART-naive subjects with HIV-B infection were used to study CTL cross-responses between HIV clade B and C peptide sequences. 204/826 overlapping peptide epitopes tested were common between both clades in eliciting CTL responses that were of similar magnitude and frequency in both HIV-B and -C. Higher magnitudes and frequencies of responses were detected with peptides from Gag, Pol, Env and Nef proteins, while peptides from Rev, Vif, Vpu, Vpr and Tat were recognized less often.
- 27 peptides from immunodominant regions of higher inter-clade homology in Gag, Nef, Pol, Vpr, Env and Vif were found to be common between both clades in eliciting the greatest CTL responses. Although these 27 peptides differed by up to 39% between clades, CTL responsiveness was not affected.
- Cross-recognized peptides had a lower entropy of recognition than clade-B specific variants, suggesting that published conserved clade-B sequences are also more conserved between clades. Consensus sequences therefore occurred in virus regions of low intra-clade entropy and high inter-clade homology.
- 18/27 highly immunogenic clusters were previously reported by Frahm et al. [J. Virol. 78:2187-2200 (2004)].
- This peptide, aAtLEEMMTACQGVGGPSH differs from the consensus C sequence gAsLEEMMTACQGVGGPSH at 2 amino acid positions, i.e. by 10.5%.

Assay type CD8 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords subtype comparisons
References Kaushik *et al.* 2005

- T cell responses to Gag consensus C peptides were studied in C-infected patients from India. CD8+ responses were stronger and broader than CD4+ responses. IFN-γ response was higher in both CD8+ and CD4+ T cells than corresponding IL-2 response, that was detectable only in CD4+ T cells.
- 1/25 patients responded to this peptide (IFN-γ CD8+ response). An IL-2 response was not detectable.

HXB2 Location p24 (213–221)
Author Location Gag
Epitope EMMTACQGV
Epitope name E9V
Immunogen vaccine
Vector/Type: measles virus (MV) *Strain:* multiple epitope immunogen *HIV component:* gp140, gp140ΔV3
Species (MHC) transgenic mouse (A*0201)
Assay type Chromium-release assay, Flow cytometric T-cell cytokine assay
Keywords memory cells, vaccine antigen design, antibody generation, characterizing CD8+ T cells
References Lorin *et al.* 2005a

- A recombinant measles MVSchw virus expressing an HIV-1-derived polyepitope effectively primed HLA-A*0201-restricted CTL responses against multiple conserved HIV-1 epitopes in HLA-A*0201 transgenic mice. Also, a recombinant MVSchw virus expressing gp140 with deleted V1, V2, and V3 loops successfully induces neutralizing antibodies against HIV-1. A live attenuated measles vaccine could provide a safe and efficient pediatric vaccination vector for simultaneous vaccination against HIV and measles.

Epitope EMMTACQGV
Epitope name Gag345
Immunogen HIV-1 infection, vaccine
Vector/Type: peptide *HIV component:* p24 Gag *Adjuvant:* Incomplete Freund's Adjuvant (IFA)
Species (MHC) human, transgenic mouse (A2)
Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay, Flow cytometric T-cell cytokine assay
Keywords binding affinity, subtype comparisons, computational epitope prediction
References Corbet *et al.* 2003

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This peptide was a good A2 binder, and induced a response in 1/6 transgenic mice. Responses were detected in 1/17 HIV+ HLA-A2 subjects.

CTL CD8+

Epitope EMMTACQGV
Epitope name Gag 345
Immunogen HIV-1 infection
Species (MHC) human (A2)
Country Denmark
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining, Chromium-release assay, Flow cytometric T-cell cytokine assay
References Thorn *et al.* 2007

- 11 HLA-A2+ (A*0201, A*0220, A*0234 or A*0236), patients' HIV were sequenced. Of 28 epitopes studied, most were conserved and elicited a subdominant CTL response. 9 epitopes in 7 proteins showed T-cell cross reaction. These epitopes were optimized to induce more immunogenic but cross-reacting responses.
- Epitopes in Gag, Pol, Env, Nef were more conserved than epitopes in shorter proteins Vpu, Vif, Vpr and Rev. Most natural epitopes were untargeted or targeted by 1 or 2 patients.
- Gag 345 EMMTACQGV epitope was highly conserved, being found in all 11 patients but none had immune responses to it. Only 1 of 17 patients had CTL recall response to it.

Epitope EMMTACQGVGGPGHK
Immunogen HIV-1 infection
Species (MHC) human (A11)
Donor MHC A11, A2, B60, B7; A11, A2, B44, B60
Country Australia
Assay type proliferation, CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Dyer *et al.* 2008

- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.
- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- Peptide 87 (NIH ARRP Cat# 7958), EMMTACQGVGGPGHK, contains an epitope restricted by HLA-A11 in different patients and elicited the following CTL responses: (1) 844 sfc/million PBMC for 11.3 years in a living non-progressor (2) 318 sfc/million PBMC for 12 years in a former non-progressor who succumbed to a non-AIDS death.

Epitope ACQGVGGPGHK
Epitope name AK11
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A*11)
Country Australia, Canada, Germany, United States
Keywords HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-A*11-associated substitution within optimally defined epitope ACQGVGGPGHK is at positions G9, ACQGVGGPgHK. Recognition frequency of AK11 was > 30% and escapes were seen 22 months post-infection.

Subtype B, CRF01_AE
Immunogen HIV-1 infection
Species (MHC) human (A*1101)
Keywords subtype comparisons, TCR usage
References Fukada *et al.* 2002

- Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals.
- ACQGVGGPGHK was found to elicit clade-specific responses in clade B (ACQGVGGPGHK is most common in clades A and B) and clade E (acqgvggpShk is most common and is also common in clades C and D). ACQGVGGPGHK was recognized by CTL from 4/5 B clade infected Japanese subjects, and acqgvggpShk from 3/7 E clade infected Thai subjects.
- The binding of the two variants to HLA A*1101 was almost identical, but bulk CTL generated from individuals did not cross-react with the cross-clade peptides, indicating the lack of cross-reactivity was due to TCR specificity.

Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay
Keywords dynamics, acute/early infection, characterizing CD8+ T cells
References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape,within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape muations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

- 4/14 optimal HIV-1 T-cell epitopes in a subject underwent mutation associated with dramatic loss of the original CD8 response. For 1 of the escape variants, a novel CD8 T-cell response equal in magnitude to the wild type, was generated. CD8 T-cell recognizing the variant epitope utilized a distinct T-cell receptor and did not exhibit any cross-reactivity against the wild type.
- A novel CD8 T-cell response was generated against the escape variant acqgvggpShk.
- Additional analyses showed that the majority of individuals expressing HLA-A11 targeted the acqgvggpShk variant sequence while the wild-type sequence was less frequently recognized.

References Malhotra *et al.* 2007b

- T-cell responses to clade B Gag peptides were tested using sequences based on consensus (CON), most recent common ancestor (ANC) and center of tree (COT); as well as CON sequences from clade A, clade C and M-group Gag. It was found that Gag-specific cross-clade T-cell IFN-gamma responses are detectable during primary infection, and there was no significant difference in breadth or magnitude of responses with the different peptide sets. While several epitopes in low diversity domains are invariant across clades, other recognized variants are seen outside HLA anchor positions. T-cell immunity often tolerates conservative or semi-conservative amino acid substitutions but changes presumed to be in TCR contact sites may abrogate epitope recognition.
- Epitope sequences for this eptiope, AK11 are invariant between CON B, COT B, ANC B and M-group. Cross-recognition is seen only to the A-clade variant. An anchor residue is at position 11; while the C-clade variant contains a semi-conservative change at position 9 to ACQGVGGPsHK. HLA-A11 restriction was inferred based on the subject possessing the appropriate HLA class I allele and prior publication.

- CTL responses were studied in treated and untreated donors from China, using Gag peptides from Henan isolate. All peptides were predicted to have A2 or A11 restriction (two of the most prominent alleles in Chinese population) and HLA restriction was further analyzed by CTL recognition in patients carrying corresponding allele. Among treated donors, HLA-A2 donors had higher CTL response than than HLA-A11 donors. Chronically infected untreated individuals had higher magnitude of CTL response than treated ones.

Species (MHC) human (B7)
Keywords HAART, ART
References Mollet *et al.* 2000

- A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFNgamma production to measure responses.
- In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished.
- Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.

Epitope GPGHKARVL
Subtype B, C
Immunogen HIV-1 infection
Species (MHC) human (B*07)
Country Canada, South Africa
References Carlson *et al.* 2008

- A statistical model, the phylogenetic dependency network (PDN), was developed to differentiate the confounding effects of codon variation, linkage disequilibrium of HLA alleles and HIV phylogeny from HLA-associated evolution including HIV selection by HLA-pressure and codon evolution.
- This approach was applied to 2 cohorts of 1144 Gag sequences from HIV-infected individuals, generating associations between HIV codons themselves and codons with HLA alleles. Results generated predicted escapes that confirmed that escape kinetics and compensating mutations are consistent across clades. General patterns of covariation and CTL adaptation were determined. Some clade-based differences were identified.
- Clades B and C, HLA-B*07-restricted optimal epitope GPGHKARVL has a susceptible form, GPsHKARVL.

CTL CD8+

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-B*07-associated substitution within optimally defined epitope GPGHKARVL is at positions G3, GPgHKARVL. With a low recognition frequency of ∼20%, GL9 also has a low rate of escape.

Keywords characterizing CD8+ T cells
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Assay type CD8 T-cell Elispot - IFNγ
Keywords escape, HLA associated polymorphism
References Bhattacharya *et al.* 2007

- Host HLA associated mutational patterns in HIV can be a consequence of immune escape, but to cleanly resolve whether or not such patterns are the result of lineage effects or immune pressure, it is helpful to incorporate the phylogenetic history of the virus into the test statistics. Most of the HLA associations that appeared to result from immune escape in an earlier study (Moore et al., Science 296:1439 2002) were found to be a consequence of the phylogenetic history of the virus, not immune escape. Other HLA associations were validated, and some additional HLA-associated mutations were identified through incorporating the viral phylogenetic tree in the analysis.
- The third position of this epitope GPgHKARVL has a mutational pattern that is correlated HLA B*0702. This epitope was experimentally tested using IFN-gamma Elispot and functional avidity studies.

References Geldmacher *et al.* 2007a

- 56 ART-naive subjects were studied to assess whether T-cell responses to Gag and Nef are biased towards infecting subtype recognition, in a setting of epidemic consisting of subtypes A,C and D and their recombinant forms. The infecting subtype was determined by multi-region hybridization assay. Overlapping 15-mer isolate-based Gag and Nef peptide sets representative of local subtypes were used. The best recognized epitope variant in terms of magnitude and breadth corresponded to infecting subtype, in this case usually type-C. Hot spots of CTL recognition in Gag were in p24, p17 and p15; hotspots against Nef were in its central, conserved region.
- Epitope variants GPsHKARVL and GPgHKARVL were studied as peptide sequences ACQGVG-GPsHKARVL (subtypes C and D) and ACQGVG-GPgHKARVL (subtype A) with 12.5% responders. Subtypes C and D were best recognized. Associated HLAs frequently expressed within the studied cohort are listed in the study as B07, B42 and B81.

Keywords supertype, cross-presentation by different HLA, TCR usage, HLA associated polymorphism
References Leslie *et al.* 2006

- 14 promiscuous HIV-specific CTL epitopes presented by B7 supertype alleles were described. It was shown that CTLs targeting an identical epitope that are restricted by closely related but different HLA alelles differ in several ways: by occurrence of distinct HLA-specific escape mutations, by recruitment of distinct TCRs by peptide/MHC complexes, and by functional avidity of CTLs. Since there were no differences in the frequency, magnitude or immunodominance of the CTL responses restricted by different HLA alleles, it is suggested that the unique peptide/MHC complexes generated by closely related HLA induce qualitatively different CTL responses.
- A strong negative association between B*0702 and conservation of sequence is observed.
- Statistically significant associations between numbers of HLA-B0702 and -B4201 expressing subjects and epitope GPGHKARVL were found.

References Zhai *et al.* 2008

- 49 ART-naive chronically HIV-1 infected Chinese subjects' CTLs were tested with 413 OLPs in IFN-gamma assays, determining optimal epitopes specific for Chinese Clade B HIV-1 sequences.
- An inverse correlation was found between CTL response and viral load.
- Targeted peptides have lower entropy than peptides that are not CTL targeted. This correlation is independent of HLA-restriction.
- Author defined epitope GPSHKARVL elicited an immune response in Chinese HIV-1 positive subjects as part of peptide ACQGVGGPSHKARVLAEA. This epitope differs from the previously described HLA-B7-restricted epitope, GPGHKARVL, at 1 residue, GPsHKARVL.
- 1 of the 9 HLA-B7 carriers responded to GPsHKARVL-containing peptide with average magnitude of CTL response of 870 SFC/million PBMC (author communication and Fig.1).

II-B-4 Gag p24-p2p7p1p6 CTL/CD8+ epitopes

HXB2 Location p24-p2p7p1p6 (221–4)

Epitope `VGGPGHKARVLAEAM`
Immunogen HIV-1 infection
Species (MHC) human (A2, B7)
Donor MHC A11, A2, B60, B7; A2, A32, B44, B7
Country Australia
Assay type proliferation, CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Dyer *et al.* 2008

- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.
- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- Peptide 89 (NIH ARRP Cat# 7960), VGGPGHKARVLAEAM, which contains epitopes restricted by HLA-A2 and -B7 in different patients, elicited the following CTL responses: (1) at 11.3 years in a living non-progressor (2) 56 sfc/million PBMC in another living non-progressor for 22+ years.

HXB2 Location p24-p2p7p1p6 (221–4)
Author Location Gag
Epitope `VGGPSHKARILAEAM`
Subtype A, CRF01_AE
Immunogen HIV-1 infection
Species (MHC) human
Country Cote D'Ivoire
Assay type CD8 T-cell Elispot - IFNγ, Other
Keywords subtype comparisons
References Aidoo *et al.* 2008

- Factors affecting cross-subtype immunity were evaluated by west Cote d'Ivoire subjects' INF-gamma ELISpot responses to OLPs from a CRF02_AG candidate vaccine, a west Kenyan subtype A virus and a Thai CRF01_AE sequence. 15 test subject sequences were primarily CRF02_AG or CRF02_AG-like, but also pure subtypes A and D. Cross-reactive responses to Gag as well as Env peptides were seen, though the response magnitude to Env was lower, perhaps due to its greater sequence variation.
- 1 subject responded to peptide VGGPSHKARILAEAM from subtype A and to peptide VGGPSHKARvLAEAM from subtype CRF01_AE.

Assay type Intracellular cytokine staining, Other
Keywords rate of progression, escape, immune evasion
References Karlsson *et al.* 2007

- To correlate evolving HIV-1 populations with HLA-A2 restricted immune responses for epitopes in Gag, Pol, Env and Nef, 11 treatment-naive subjects were longitudinally studied. Results show that increased viral load is often associated with broad CTL responses early in infection that persist as an "immunological footprint". Conversely, early, restricted responses may help limit viral load. Phylogenetic and functional evidence of viral escape is seen in Gag, Nef and Pol. Gag and Nef show flanking epitope changes restricted by non-HLA-A2 alleles. As far as modes of viral adaptation, CTL responses were seen to develop both against static viral populations resulting in viral evolution to HLA-A2 as well as against existing mutants resulting in reselection of consensus B-like variants. This study reinforces that CTL immune responses detected are not necessarily beneficial to patients, but may be "footprints" from early effective responses that the virus has since escaped.

HXB2 Location p24-p2p7p1p6 (230–7)
Author Location Gag (386–)
Epitope VLAEAMSQV
Epitope name Gag-386
Immunogen
Species (MHC) human (A*0201)
Keywords binding affinity, subtype comparisons, supertype, computational epitope prediction, immunodominance
References Altfeld *et al.* 2001c

- HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested.
- Three additional previously described HLA-A2 epitopes were added to the set of 20, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2)
- VLAEAMSQV binds to all five HLA-A2 supertype alleles tested: A*0201, A*0202, A*0203, A*0206 and A*6802 (highest affinity)
- 4/22 individuals with chronic HIV-1 infection recognized this epitope, and it was immunodominant in 3/4 by ELISPOT.
- 0/12 acutely infected individuals recognized this epitope.

Epitope VLAEAMSQV
Epitope name Gag 386
Subtype M
Immunogen vaccine, in vitro stimulation or selection, computer prediction
Vector/Type: DNA, peptide *Adjuvant:* Incomplete Freund's Adjuvant (IFA)
Species (MHC) human, mouse, humanized mouse (A*0201)
Assay type Cytokine production, T-cell Elispot
Keywords subtype comparisons, computational epitope prediction, escape, TCR usage, variant cross-recognition or cross-neutralization
References McKinney *et al.* 2004

- This study examined variant recognition of epitopes presented by A*0201 and A*1101. Numerous amino acid substitutions can be introduced into epitopes without disrupting their recognition by CTLs, although epitopes with multiple substitutions were less recognized. An algorithm was constructed for prediction of epitopes capable of inducing responses to a great number of variant epitopes.
- A total of 20 variant forms of Gag 386 were identified. More than 95% of the variant epitopes were recognized by CTLs from mice immunized with the parental form.
- Gag 386 epitope (parent or variant form) was present in 97% of HIV sequences of many M group subtypes.

CTL CD8+

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This peptide was a good A2 binder that induced CTL and CD8+ T-cell IFN gamma responses in mice. Responses were detected in 1/17 HIV+ HLA-A2 subjects.
- The variant vlaeamsqA was also immunogenic in A2 transgenic mice, eliciting a CD8+ T-cell response, as was recognized in 3/17 HIV+ people, including the person that recognized the vlaeamsqV variant.

Keywords responses in children, mother-to-infant transmission, escape, acute/early infection, viral fitness and reversion
References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness.
- Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- The mother was A02+ and carried a variant form of the epitope, VLAEAMShV, which she passed to her A02- child. This form persisted in her child for 15 months.

Keywords escape, HLA associated polymorphism
References Bhattacharya *et al.* 2007

- Host HLA associated mutational patterns in HIV can be a consequence of immune escape, but to cleanly resolve whether or not such patterns are the result of lineage effects or immune pressure, it is helpful to incorporate the phylogenetic history of the virus into the test statistics. Most of the HLA associations that appeared to result from immune escape in an earlier study (Moore et al., Science 296:1439 2002) were found to be a consequence of the phylogenetic history of the virus, not immune escape. Other HLA associations were validated, and some additional HLA-associated mutations were identified through incorporating the viral phylogenetic tree in the analysis.
- Mutational patterns in the ninth position, AEAMSQVTnS, in this epitope are correlated with the host carrying HLA B*4002.

Country Australia
Assay type proliferation, CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Dyer *et al.* 2008

- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.
- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.

- Peptide 92 (NIH ARRP Cat# 7963), EAMSQVTNSATIMMQ, contains an epitope restricted by HLA-A2 in different patients and elicited the following CTL immune responses: (1) for 19+ years in a living non-progressor (2) for 22+ years in another living non-progressor (3) for 22+ years in a former non-progressor who succumbed to loss of viremic control (4) for 19+ years in yet another living non-progressor.

Epitope SQVTNSATI
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A*02)
Country China
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining, Other
Keywords assay standardization/improvement, optimal epitope
References Wang *et al.* 2007c

- HLA-A11-restricted CTL epitopes in 2 male Han Chinese subjects (one ART naive and one receiving HAART) were determined. A novel epitope was discovered and 5 other putative epitopes confirmed using 425 overlapping peptides spanning the entire HIV-1 clade B proteome. By employing intracellular cytokine staining, the authors developed a new method of mapping optimal epitopes and defining their HLA restriction efficiently. In spite of its being the most common HLA type in China, A*11-restricted epitopes were recognized less frequently than other epitopes, and A*11-restricted responses formed a mean of only 13% of the responses against HIV.
- This epitope, SQVTNSATI, was detected within overlapping peptide EAMSQVTNSATIMMQR.

HXB2 Location p2p7p1p6 (5–13)
Author Location Gag (SF2)
Epitope SQVTNPANI
Immunogen vaccine
Strain: B clade SF2 *HIV component:* Gag
Species (MHC) mouse (H-2D^b)
References Paliard *et al.* 1998

- HIV-1 (SF2)p55gag vaccination of H-2 mice activates a CTL response against this epitope.
- CTL that recognized SQVTNPANI in the context of H-2D^b cross-reacted with H-2 alloantigens H-2L^d and an unidentified self-peptide.
- A postulate: heterozygosity at the MHC level could prevent the maturation of some T cell receptor combinations for foreign peptide and self-MHC constructs because of thymic depletion and tolerance.

Epitope `KEGHIAKNCRAPRKK`
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Bailey *et al.* 2008

- This is the first documentation of transmission of HIV-1 from a patient who developed AIDS (Progressor) to an Elite Suppresssor (ES).
- Both patients are HLA-B*5703-positive. The ES also has B*27 allele. Escape mutations in HLA-B*57-restricted epitopes were present in both patients, suggesting that they by themselves cannot explain the difference in the outcomes.
- The study concluded that viral replication is controlled in ES by at least two mechanisms: (i) direct inhibition of viral replication by polyfunctional HIV-1 specific CD8+ T cells that proliferate in response to autologous viral peptides; (ii) selection for and maintenance of escape mutations that have a negative impact on viral fitness.
- This epitope elicited IFN-γ response in the ES. Both the ES and the Progressor had K411R substitution.

HXB2 Location p2p7p1p6 (38–47)
Author Location p7 (401–410)
Epitope `IAKNCRAPRK`
Epitope name IAKK10
Subtype D
Immunogen HIV-1 infection
Species (MHC) human (A*03)
Country Kenya
References Peters *et al.* 2008a

- Gag sequences from 468 HIV-1 positive sex workers from the Kenyan Pumwani cohort were analyzed to bioinformatically identify positively selected residues that could be related to antigen processing. Mutation effects on disease progression were followed by mean CD4 counts. This method is also one way of identifying potential CTL epitopes and classifying them.
- A Gag positive selection map was generated and sites were classified as beneficial or harmful to HIV. They were correlated to antigen processing (proteasomal cleavage), antigen presentation (TAP transport efficiency) and T-cell receptor binding.
- p17 and p24's structural constraints limited their diversity, while p7-p1-p6 showed a higher average entropy.
- Epitope IAKNCRAPRK, is unique to this Kenyan cohort. Its optimal, published epitope is LARNCRAPRK (LARK10). HLA-A*0301-restricted mutant K403R, IArNCRAPRK, is shown to be under selection pressure. D clade adapted IAKNCRAPRK has a substantially reduced TAP binding compared with optimal LARK10

Epitope `LARNCRAPRK`
Epitope name A*3101 LR9
Immunogen HIV-1 infection
Species (MHC) human (A*3101)
Country Australia
Assay type CD8 T-cell Elispot - IFNγ
Keywords escape, HLA associated polymorphism
References Bhattacharya *et al.* 2007

- Host HLA associated mutational patterns in HIV can be a consequence of immune escape, but to cleanly resolve whether or not such patterns are the result of lineage effects or immune pressure, it is helpful to incorporate the phylogenetic history of the virus into the test statistics. Most of the HLA associations that appeared to result from immune escape in an earlier study (Moore et al., Science 296:1439 2002) were found to be a consequence of the phylogenetic history of the virus, not immune escape. Other HLA associations were validated, and some additional HLA-associated mutations were identified through incorporating the viral phylogenetic tree in the analysis.
- The third position of the epitope LArNCRAPRK an HLA-A*3101 correlated amino acid, however which one of the two common forms, LArNCRAPRK or LAkNCRAPRK, was the escape or and which was the susceptible form depended on the patient tested. Testing was performed by IFN-gamma ELIspot (magnitude) and functional avidity studies.

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially a showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

Assay type CD8 T-cell Elispot - IFNγ
Keywords binding affinity, subtype comparisons, acute/early infection
References Malhotra *et al.* 2007b
- T-cell responses to clade B Gag peptides were tested using sequences based on consensus (CON), most recent common ancestor (ANC) and center of tree (COT); as well as CON sequences from clade A, clade C and M-group Gag. It was found that Gag-specific cross-clade T-cell IFN-gamma responses are detectable during primary infection, and there was no significant difference in breadth or magnitude of responses with the different peptide sets. While several epitopes in low diversity domains are invariant across clades, other recognized variants are seen outside HLA anchor positions. T-cell immunity often tolerates conservative or semi-conservative amino acid substitutions but changes presumed to be in TCR contact sites may abrogate epitope recognition.
- This epitope, CTERQANFL, is invariant across CON A, B, C and M-Group sequences, as well as clade B COT and ANC sequences. HLA-B61 restriction was inferred based on subject possessing appropriate HLA class I allele and prior publication.

Epitope CTERQANFL
Immunogen HIV-1 infection, vaccine
Vector/Type: canarypox *Strain:* B clade LAI, B clade MN *HIV component:* Gag-Pol, gp120, gp41
Species (MHC) human
Donor MHC A*0201, A*1101; B*4002, B*5101
Assay type CD8 T-cell Elispot - IFNγ, Flow cytometric T-cell cytokine assay
Keywords vaccine-induced epitopes
References Horton *et al.* 2006b

- T cell responses during early infection in individuals previously enrolled in HIV vaccine trials were compared with those of nonvaccinated subjects.
- None of the breakthrough infections possessed vaccine-induced T-cell responses preinfection and 85-86% of vaccinees and nonvaccinees with primary infection developed T-cell responses postinfection, indicating that vaccinees' ability to mount T-cell response postinfection is not compromized by previous immunization.
- Breakthrough subjects recognized 43 T-cell epitopes, 8 of them novel, and 25% were present in the vaccine.
- This epitope was contained in the vaccine, the vaccinated patient recognized it both before and after infection.

Epitope TERQANFL
Epitope name TL8
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B*40)
Country Australia, Canada, Germany, United States
Keywords HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-B*40-associated substitution within optimally defined epitope TERQANFL is at position T1, TERQANFL.

Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining
Keywords epitope processing, immune evasion, viral fitness and reversion, HLA associated polymorphism
References Honeyborne *et al.* 2007

- To determine whether HLA-B*13-restricted CTL responses could partially explain low viremic loads in patients, a cohort of chronic C-clade infected subjects was studied. 6 novel B*13-restricted CTL epitopes were defined from both C- and B-clade viruses, 3 of which were within Gag. B*13-restricted CTL responses correlated with lower viremia, with most immunity targeted against Gag epitopes (p15, p17, p24). Gag epitope escape variants may exact a high viral fitness cost, mutations being seen within and around the optimal epitope.
- Mutations in this epitope, RQANFLGKI, were seen at K436R i.e. to RQANFLGrI as well as at I437VLM i.e. to RQANFLGKv, RQANFLGKl and RQANFLGKm. These C-terminii variants may compromise viral fitness by interference with protease cleavage between p7 and p1.

Epitope RQANFLGKIWPSYKG
Immunogen HIV-1 infection
Species (MHC) human (A2)
Country Australia
Assay type proliferation, CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Dyer *et al.* 2008
- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that coincided with LTNP status, but 50% did not remain non-progressors.
- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- Peptide 108 (NIH ARRP Cat# 7979), RQANFLGKIWPSYKG, contains an epitope restricted by HLA-A2 in different patients and elicited the following CTL responses: (1) for 22+ years in a living non-progressor (2) for 22+ years in another living non-progressor (3) 54 sfc/million PBMC at 21.3 years in yet another living non-progressor (4) 68 sfc/million PBMC for 12 years in a former non-progressor who succumbed to non-AIDS death (5) 319 sfc/million PBMC for 22.8 years in a former non-progressor who succumbed to loss of viremic control.

Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003
- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.

- This is the first documentation of transmission of HIV-1 from a patient who developed AIDS (Progressor) to an Elite Suppresssor (ES).
- Both patients are HLA-B*5703-positive. The ES also has B*27 allele. Escape mutations in HLA-B*57-restricted epitopes were present in both patients, suggesting that they by themselves cannot explain the difference in the outcomes.
- The study concluded that viral replication is controlled in ES by at least two mechanisms: (i) direct inhibition of viral replication by polyfunctional HIV-1 specific CD8+ T cells that proliferate in response to autologous viral peptides; (ii) selection for and maintenance of escape mutations that have a negative impact on viral fitness.
- This epitope elicited IFN-γ response in the Progressor, who had H441Y substitution.

Keywords binding affinity, immunodominance
References Frahm *et al.* 2004

- To identify HLA-independent immunodominant regions in HIV clade B across different ethnicities, the authors analyzed CTL responses to HIV in African-American (AA), Caucasian (C), Hispanic (H) and West Indian (WI) cohorts, and analyzed factors infuencing immune dominance. Host HLA-A11 and -A25 distributions differed among ethnicities significantly. The virus regions most targeted by CTLs in breadth and magnitude were in Gag, Nef and Int proteins (Nef-76, most targeted). Pro was the least targeted. 88% of peptides across the entire HIV sequence elicited CTL responses. 6 peptides tested were most differentially targeted between ethnicities. 3 frequently targeted and 10 highly CTL-reactive regions across all 4 ethnicities were noted for vaccine design purposes.
- Suppressive treatment rather than treatment itself was found to diminish CTL responses, whose breadth and magnitude correlates with CD4 count and not viral load. Factors found to determine peptide recognition by CTLs were (i) conserved peptides displaying low entropy (ii) low fraction of forbidden amino acids and (iii) high proteasomal cleavage score, confirming previous informatic studies [Yusim et al. J.Virol. 76:8757-68 (2002)]. These 3 variables did not correlate with each other but an inverse trend was seen between cleavage score and entropy.
- In addition, since all ethnicities were able to mount CTL responses to every HIV protein and only <12% of peptides were not recognized by any subject, the consensus sequence-based approach to vaccine design is substantiated.
- This immunodominant, frequently targeted overlapping peptide, RQANFLGKIWPSHKGR, had an overall frequency of recognition of 23.3% - 18.6% AA, 30.8% C, 31.8% H, 9.5% WI. This peptide is included in a 27 aa Gag-p15 highly reactive region to be used for vaccine design.

- 11 HLA-A2+ (A*0201, A*0220, A*0234 or A*0236), patients' HIV were sequenced. Of 28 epitopes studied, most were conserved and elicited a subdominant CTL response. 9 epitopes in 7 proteins showed T-cell cross reaction. These epitopes were optimized to induce more immunogenic but cross-reacting responses.
- Epitopes in Gag, Pol, Env, Nef were more conserved than epitopes in shorter proteins Vpu, Vif, Vpr and Rev. Most natural epitopes were untargeted or targeted by 1 or 2 patients.
- Gag 433 FLGKIWPS epitope was found in 9 patients and was frequently targeted as 5 had CTL immune responses to it. Non-identical patient isolates of this epitope had 1 or more amino acid differences that elicited a positive CTL response.

- Comparative genetic and immunological study was conducted of two subjects - patient DK1 with no viremia for >10 years after transient ART and despite continued sexual contact with patient UG1 (his wife) who was an HIV-1-positive non-controller.
- DK1 and UG1 shared most crossover points of recombination but while DK1 had subtype A1 Env, UG1's Env was subtype D. In the shared subtype A1/D regions, homology between the patients' sequences was 98%.
- Out of 23 conserved HLA-A02 epitopes, HLA-A2+ DK1 produced CTL response and IFN-gamma response only to epitope ILKEPVHGV.
- DK1 produced neutralizing antibody only to homologous isolates. It is suggested that early, transient ART may have resulted in full control of viremia and disease via the very narrow specific CTL response and neutralizing antibody.
- Despite carrying HLA-A2, DK1 did not respond to HLA-A2 Gag epitope FLGKIWPS, though it did elicit response in a cohort of 11 other HIV-1 + HLA-A2+ patients.

- To correlate evolving HIV-1 populations with HLA-A2 restricted immune responses for epitopes in Gag, Pol, Env and Nef, 11 treatment-naive subjects were longitudinally studied. Results show that increased viral load is often associated with broad CTL responses early in infection that persist as an "immunological footprint". Conversely, early, restricted responses may help limit viral load. Phylogenetic and functional evidence of viral escape is seen in Gag, Nef and Pol. Gag and Nef show flanking epitope changes restricted by non-HLA-A2 alleles. As far as modes of viral adaptation, CTL responses were seen to develop both against static viral populations resulting in viral evolution to HLA-A2 as well as against existing mutants resulting in reselection of consensus B-like variants. This study reinforces that CTL immune responses detected are not necessarily beneficial to patients, but may be "footprints" from early effective responses that the virus has since escaped.
- Two patients developed responses to epitope FLGKIWPSHK during primary infection and one after primary, during early chronic infection. This was one of the epitopes targeted by broad HLA-A2-restricted CTL responses.

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Epitope FLGKIWPSYK
Immunogen HIV-1 infection
Species (MHC) human (A02)
Assay type CD8 T-cell Elispot - IFNγ, HLA binding
Keywords binding affinity, immunodominance, optimal epitope
References Bihl *et al.* 2006

- CTL responses were tested for both HIV-1 and EBV derived epitopes restricted by HLA-A, -B and -C alleles. HLA-B alleles more frequently induce detectable responses and that the responses are generally of greater magnitude than those for HLA-A and -C alleles.
- The magnitude and frequency of CTL recognition were related to each other and that TCR avidity for HLA/peptide complexes is a more important determinant for magnitude of response than peptide binding affinity to HLA.
- EBV response patterns were not significantly altered by HIV coinfection.
- Epitope FLGKIWPSYK elicited a magnitude of response of 200 SFC with a functional avidity of 5nM and binding affinity of 40nM.

Immunogen HIV-1 infection
Species (MHC) goat (A2)
Country United States
Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay, HLA binding
Keywords acute/early infection, optimal epitope
References Altfeld *et al.* 2005

- The most frequently targeted HLA-A2-restricted CD8+ T-cell epitopes in chronic infection were significantly less frequently recognized during primary infection. This epitope was only recognized during chronic infection, in 54% of 74 chronically infected A2+ individuals, but in no acute cases (0/14).

HXB2 Location p2p7p1p6 (70–79)
Author Location p2p7p1p6
Epitope FLGKIWPSYK
Epitope name A2-FK10(p1)
Immunogen HIV-1 infection
Species (MHC) human (A2)
Assay type CD8 T-cell Elispot - IFNγ

Keywords rate of progression, immunodominance, early-expressed proteins
References Altfeld *et al.* 2006

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

HXB2 Location p2p7p1p6 (70–79)

Epitope FLGKIWPSHK
Subtype B, C, A1, AE
Immunogen HIV-1 infection
Species (MHC) human (A2)
Country Sweden
Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons, computational epitope prediction
References Pérez *et al.* 2008

- Bioinformatic prediction using NetCTL 1.0, Episelect and NetMHCpan generated 184 CTL epitopes from Gag, Pol, Nef, Env and Tat in HIV subtypes A, B, C, D and CRF01_AE, restricted by MHC A1, A2, A3, A24, B7, B44 and B58. 45 of the 114 epitopes recognized experimentally in subjects were novel, and an elite subgroup comprising 21 epitopes were recognized by at least 13% of patients tested.
- Response magnitude was high—Gag and Nef, Env, Tat in descending order). While Gag, Pol, Env and Nef were highly immunocgenic, only 38% Tat epitopes elicited a response.
- 4 patterns of cross-subtype recognition found were (a) conserved epitopes recognized by patients infected with several HIV subtypes (b) infrequently found reference epitopes recognized by patients infected with several HIV subtypes (c) epitopes more prevalent in certain subtypes recognized by patients infected with several subtypes (d) rarely, subtype-specific epitopes unable to elicit cross-clade recognition
- The well identified, immunogenic HLA-A2-restricted epitope FLGKIWPSHK of HIV-Gag was used in a peptide pool to stimulate PBMCs from 31 HIV-1 + subjects by ELISpot assay.

HXB2 Location p2p7p1p6 (70–79)

Epitope FLGKIWPSHK
Epitope name FK10
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A2)
Country United States
Assay type CD8 T-cell Elispot - IFNγ, Tetramer binding, Flow cytometric T-cell cytokine assay
Keywords characterizing CD8+ T cells
References Streeck *et al.* 2008a

- T-cells were studied for exhaustion and dysfunction in chronic HIV infection. Polyfunctionality of CTL immune response to HIV-1 decreased with persistence of antigen presence over time in chronic infection. CTL exhaustion can thus be halted by reduction in viral antigen load - either by ART or through escape mutations.
- PD-1, marker for activation and apoptosis increases over time, but it decreases when epitope mutations develop. CD127 however, is not impacted by viral escape.
- Epitope, FLGKIWPSHK, went from 3-4 functional to monofunctional in the response it was able to elicit with no sequence change in an untreated patient. Previously published HLA-restriction for FK10 was HLA-A2.

HXB2 Location p2p7p1p6 (70–79)
Author Location p2p7p1p6
Epitope FLGKIWPSHK
Epitope name FK10(p2p7p1p6)
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Country China
Assay type CD8 T-cell Elispot - IFNγ
References Zhai *et al.* 2008

- 49 ART-naive chronically HIV-1 infected Chinese subjects' CTLs were tested with 413 OLPs in IFN-gamma assays, determining optimal epitopes specific for Chinese Clade B HIV-1 sequences.
- An inverse correlation was found between CTL response and viral load.
- Targeted peptides have lower entropy than peptides that are not CTL targeted. This correlation is independent of HLA-restriction.
- Author defined epitope FLGKIWPSHK elicited an immune response in Chinese HIV-1 positive subjects as part of peptide RQANFLGKIWPSHKGR. This epitope differs from the previously described HLA-B7-restricted epitope, FLGKIWPSYK, at 1 residue, FLGKIWPShK.
- 11 of the 55 HLA-A2 carriers responded to FLGKIWPShK-containing peptide with average magnitude of CTL response of 188 SFC/million PBMC.

HXB2 Location p2p7p1p6 (70–84)
Author Location
Epitope FLGKIWPSYKGRPGN
Immunogen HIV-1 infection
Species (MHC) human (A2)
Country Australia
Assay type proliferation, CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Dyer *et al.* 2008

- 13 TAHIV (transfusion acquired HIV) LTNPs were studied longitudinally for up to 27 years to find correlations and indicators of elite control versus delayed progresson to AIDS. 12 of 13 subjects had one or more host genetic factor that

CTL CD8+

coincided with LTNP status, but 50% did not remain non-progressors.

- Immune factors that correlated with LTNP status were very low HIV viremia (<100 copies/ml) associated with Gag p24 proliferative CD4 response. Decline in p24-induced proliferation strongly preceded loss of non-progression to AIDS. Strong Gag-specific CTL responses in one sub-cohort were indicative of control while Pol-specific responses were effective in controlling HIV replication in the other sub-group.
- Peptide 109 (NIH ARRP Cat# 7980), FLGKIWPSYK-GRPGN, contains an epitope restricted by HLA-A2 in different patients and elicited the following CTL responses: (1) for 22+ years in a living non-progressor (2) for 22+ years in another living non-progressor (3) 72 sfc/million PBMC at 21.3 years in yet another living non-progressor (4) 68 sfc/million PBMC for 12 years in a former non-progressor who succumbed to non-AIDS death (5) 319 sfc/million PBMC for 22.8 years in a former non-progressor who succumbed to loss of viremic control.

HXB2 Location p2p7p1p6 (70–84)
Author Location Gag (433–447)
Epitope FLGKIWPSHKGRPGN
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Bailey *et al.* 2008

- This is the first documentation of transmission of HIV-1 from a patient who developed AIDS (Progressor) to an Elite Suppresssor (ES).
- Both patients are HLA-B*5703-positive. The ES also has B*27 allele. Escape mutations in HLA-B*57-restricted epitopes were present in both patients, suggesting that they by themselves cannot explain the difference in the outcomes.
- The study concluded that viral replication is controlled in ES by at least two mechanisms: (i) direct inhibition of viral replication by polyfunctional HIV-1 specific CD8+ T cells that proliferate in response to autologous viral peptides; (ii) selection for and maintenance of escape mutations that have a negative impact on viral fitness.
- This epitope elicited IFN-γ response in the Progressor, who had H441Y substitution.

HXB2 Location p2p7p1p6 (73–81)
Author Location p2p7p1p6 (2113–)
Epitope KIWPSYKGR
Epitope name A*3101 KR9
Immunogen HIV-1 infection
Species (MHC) human (A*3101)
Country Australia
Assay type CD8 T-cell Elispot - IFNγ
Keywords escape, HLA associated polymorphism
References Bhattacharya *et al.* 2007

- Host HLA associated mutational patterns in HIV can be a consequence of immune escape, but to cleanly resolve whether or not such patterns are the result of lineage effects or immune pressure, it is helpful to incorporate the phylogenetic history of the virus into the test statistics. Most of the HLA associations that appeared to result from immune escape in an earlier study (Moore et al., Science 296:1439 2002) were found to be a consequence of the phylogenetic history of the virus, not immune escape. Other HLA associations were validated, and some additional HLA-associated mutations were identified through incorporating the viral phylogenetic tree in the analysis.
- The seventh position (K), KIWPSYkGR, is an HLA-A*3101 correlated amino acid. The susceptible form of this epitope is KIWPSYKGR, whilst the escape form is KIWPSYrGR, as indicated by the mutational patterns; this was validated experimentally using IFN-gamma Elispot and functional avidity studies.

Epitope IWPSHKGRPGNFLQS
Subtype B
Immunogen HIV-1 infection, vaccine
Vector/Type: DNA *Strain:* B clade *HIV component:* Gag *Adjuvant:* aluminum phosphate
Species (MHC) human
Country United States
Assay type CD8 T-cell Elispot - IFNγ, Other
References Balamurugan *et al.* 2008

- To check whether unsuccessful vaccines may interfere with normal patient immune response,2 subjects were followed. The first, 00015, was seronegative while receiving vaccination, but later contracted infection. The second, 00016, had temporary sexual contact with subject 00015 and showed symptoms of disease 2 weeks before him. Without treatment, both reached low chronic viremic levels, and showed similar magnitude of immune response.
- Similar immune pressure was seen on viral sequences in both patients, over time in Gag, Pol, Nef.
- Data suggest that the vaccine failed to prime subject 00015 against HIV infection, but it did not impair ability to naturally contain viremia in comparison with infecting subject 00016.
- CTL immune response to consensus sequence IWPSHK-GRPGNFLQS was elicited in subject 00016.

References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- Predicted epitope based on an HLA motif embedded in a reactive peptide from a person carrying a D clade Gag.

Immunogen HIV-1 infection, vaccine
Vector/Type: DNA *Strain:* B clade *HIV component:* Gag *Adjuvant:* aluminum phosphate
Species (MHC) human
Country United States
Assay type CD8 T-cell Elispot - IFNγ, Other
References Balamurugan *et al.* 2008

- To check whether unsuccessful vaccines may interfere with normal patient immune response,2 subjects were followed. The first, 00015, was seronegative while receiving vaccination, but later contracted infection. The second, 00016, had temporary sexual contact with subject 00015 and showed symptoms of disease 2 weeks before him. Without treatment, both reached low chronic viremic levels, and showed similar magnitude of immune response.
- Similar immune pressure was seen on viral sequences in both patients, over time in Gag, Pol, Nef.
- Data suggest that the vaccine failed to prime subject 00015 against HIV infection, but it did not impair ability to naturally contain viremia in comparison with infecting subject 00016.
- CTL immune response to consensus sequence EPIDKELYPLA was elicited in subject 00016. Consensus epitope of subject 00015 was EtIgKELYPLA and of 00016 was EaIDKELYPLA.

Assay type CD8 T-cell Elispot - IFNγ
Keywords acute/early infection, variant cross-recognition or cross-neutralization, superinfection
References Yang *et al.* 2005b

- An individual infected with a drug-resistant strain of HIV-1 subtype B with controlled viremia became superinfected with another subtype B strain. The second strain outgrew the first despite lower replication capacity and the same viral phenotype. The strains showed differences in their epitope sequences. The CTL responses to the first strain declined after superinfection, followed by some adaptation of targeting to the new epitopes of the second strain. Differences in the recognized epitopes were suggested to have contributed to the poor immune containment of the second strain.
- A response to this epitope was detected before superinfection but diminished afterward. The epitope in the infecting and superinfecting strain had the sequence: kelyplAsl. The second infecting strain had a 4-amino acid insertion proximal to the epitope, RGIDkelyplAsl.

Epitope KELYPLTSL
Epitope name KL9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B*40)
Country Australia, Canada, Germany, United States
Keywords HLA associated polymorphism
References Brumme *et al.* 2008a

- 98 newly infected patients were studied to track early host HLA and Gag/Pol/Nef epitope immune responses' association with viral evolution. Response hierarchies were the same as those for later infection, and 50% of the most rapidly substituting epitopes were restricted by protective HLA, e.g. Gag B*57-associated mutations which were the most rapidly reverting upon transmission to a non-B*57-host. While there are great differences in mutation rates and reversions across the HIV proteome, most early viral change is driven by immune pressure.
- HLA-driven epitope evolution was seen in 80% of published CTL epitopes.
- HLA-B*40-associated substitution within optimally defined epitope KELYPLTSL is at position E2, KeLYPLTSL.

Country Australia
Assay type CD8 T-cell Elispot - IFNγ
Keywords escape, HLA associated polymorphism
References Bhattacharya *et al.* 2007

- Host HLA associated mutational patterns in HIV can be a consequence of immune escape, but to cleanly resolve whether or not such patterns are the result of lineage effects or immune pressure, it is helpful to incorporate the phylogenetic history of the virus into the test statistics. Most of the HLA associations that appeared to result from immune escape in an earlier study (Moore et al., Science 296:1439 2002) were found to be a consequence of the phylogenetic history of the virus, not immune escape. Other HLA associations were validated, and some additional HLA-associated mutations were identified through incorporating the viral phylogenetic tree in the analysis.
- The mutational patterns in the second position in the HLA B*4001 epitope KELYPLTSL are correlated with the host carrying HLA B*4001.

Keywords responses in children, mother-to-infant transmission, escape, acute/early infection, viral fitness and reversion
References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness.
- Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- A B40+ mother carried the KEmYPLaSL variant of the epitope and transmitted it to her B40- infant. The variant form continued to dominate the infant's sequences at months 3 and 15.

Immunogen HIV-1 infection
Species (MHC) human (B40)
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, early-expressed proteins
References Altfeld *et al.* 2006

- Immunodominant HIV epitopes in early, primary infection of CTLs were identified and the relative contribution of immune responses restricted to individual HLA class I molecules were studied.
- The most frequently recognised epitopes also elicited the greatest CTL response.
- HIV-1 Epitope sequence variability was not correlated with immunodominant versus immune sub-dominant responses.
- HLA-B57 and HLA-B27 restricted responses were the strongest in these early and acute infections - due to dominant responses to a single epitope in each case (TW10 for B57 and KK10 for B27).
- In the presence of HLA-B57 and HLA-B27 restricted responses, the relative contribution of other restricting HLA dropped greatly.

HXB2 Location p2p7p1p6 (118–126)

Epitope name p15-24
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B60)
Keywords immunodominance, cross-presentation by different HLA
References Yu *et al.* 2002b

- 26/57 HIV-1 infected subjects displayed Gag p15-specific CD8+ T-cell IFNgamma responses were measured by Elispot and intracellular staining. The immunodominant regions targeted by CD8+ T cells were mapped to three functional domains: the zinc finger structures, the protease cleavage site p7/p1, and to the Vpr binding site in p6.
- p15 contributed on average 17% of the total Gag response (rage 0-100%).
- 3 optimal CTL epitopes were mapped within p15: KELYPLTSL, CRAPRKKGC, and FLGKIWPSYK.
- Four patients who were HLA-B60+ recognized KELYPLTSL.
- The binding motif for B60 is C-term Leu and 2nd position Glu.
- Four patients who did not carry HLA-B60 also recognized the 15 amino acid long peptide carrying KELYPLTSL, suggesting other epitopes in this immediate region can be presented by other HLA class I molecules.

Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons, immunodominance
References Zhao *et al.* 2007

- 46 ART-naive subjects with HIV-B infection were used to study CTL cross-responses between HIV clade B and C peptide sequences. 204/826 overlapping peptide epitopes tested were common between both clades in eliciting CTL responses that were of similar magnitude and frequency in both HIV-B and -C. Higher magnitudes and frequencies of responses were detected with peptides from Gag, Pol, Env and Nef proteins, while peptides from Rev, Vif, Vpu, Vpr and Tat were recognized less often.
- 27 peptides from immunodominant regions of higher interclade homology in Gag, Nef, Pol, Vpr, Env and Vif were found to be common between both clades in eliciting the greatest CTL responses. Although these 27 peptides differed by up to 39% between clades, CTL responsiveness was not affected.
- Cross-recognized peptides had a lower entropy of recognition than clade-B specific variants, suggesting that published conserved clade-B sequences are also more conserved between clades. Consensus sequences therefore occurred in virus regions of low intra-clade entropy and high inter-clade homology.
- 18/27 highly immunogenic clusters were previously reported by Frahm et al. [J. Virol. 78:2187-2200 (2004)].
- This peptide, kElyPLaSLKSLFGnDPs differs from the consensus C sequence rEPLtSLKSLFGsDPl at 6 amino acid positions, i.e. by 33.3%.

References Jin *et al.* 2002

- Patients with HLA-B*35 variants B*3502, B*3503, B*3504, and B*5301 tend to proceed to AIDS more quickly than those with B*3501.
- Of 32 patients with HLA-B*35 alleles CD8+ CTL responses were quantified using an intracellular cytokine staining assay – 75% had responses to Pol, 69% to Gag, 50% to Nef, and 41% to Env.
- The overall magnitude of CTL responses did not differ between those bearing B*3501 and the others. A higher percentage of Gag responses was observed in those that had lower RNA levels that carried B*3501, and there was a negative association with viral load and CTL activity. The data is consistent with higher levels of CTL responses contributing to protection in B*3501 individuals, but not in B*3502, B*3503, B*3504, and B*5301 individuals.

HXB2 Location Gag
Author Location Gag (54–52)
Epitope
Epitope name pSG9
Subtype B, C
Immunogen HIV-1 infection
Species (MHC) human (B*57)
Country Canada, South Africa
Assay type Other
Keywords escape, compensatory mutation
References Carlson *et al.* 2008

- A statistical model, the phylogenetic dependency network (PDN), was developed to differentiate the confounding effects of codon variation, linkage disequilibrium of HLA alleles and HIV phylogeny from HLA-associated evolution including HIV selection by HLA-pressure and codon evolution.
- This approach was applied to 2 cohorts of 1144 Gag sequences from HIV-infected individuals, generating associations between HIV codons themselves and codons with HLA alleles. Results generated predicted escapes that confirmed that escape kinetics and compensating mutations are consistent across clades. General patterns of covariation and CTL adaptation were determined. Some clade-based differences were identified.
- A putative epitope, pSG9, , shows escape that is correlated with escape at other epitopes, TW10, IW9 and QW9.

HXB2 Location Gag
Author Location
Epitope

Immunogen vaccine
Vector/Type: canarypox prime with gp120 boost, canarypox prime with gp160 boost *Strain:* B clade LAI, B clade MN, B clade SF2 *HIV component:* Gag, gp120, gp41, Nef, Pol
Species (MHC) human (B60)
Keywords subtype comparisons, vaccine-specific epitope characteristics
References Ferrari *et al.* 2001

- Different HIV strains were used for different regions: gp41 LAI, Gag LAI, gp120 MN, gp120 SF2
- HLA-B60 responses dominated the responses against an Gag vaccine in an individual (022G0Z) who was HLA A1, A11, B8, B60. The strongest response was against the MN peptide 107-136. Low level Gag responses were observed against B8 and A11 epitopes, no response was observed against A1 epitopes.
- Vaccinee 202T7 (HLA A2, B27, C25) made the strongest response to an epitope at positions 131-140 of Gag. The response was highly cross-reactive with D clade Gag expressed from vaccinia, less so with C, and only minimally cross-reactive with A and CRF01.

HXB2 Location Gag
Author Location p24
Epitope
Immunogen vaccine
Vector/Type: DNA *HIV component:* p17/p24 Gag
Species (MHC) mouse (H-2^b, H-2^d, H-2^k)
References Iroegbu *et al.* 2000

- The p24 sequence is more conserved than is p17 within patient, and nonsynonymous substitutions are spread evenly throughout its coding regions, not concentrated in CTL epitopes.
- Minor changes in p24 did not alter the immunogenicity in H-2b,d, or k mice, while changes in p17 (92% similarity) did alter immunogenicity.

HXB2 Location Gag
Author Location Gag (SF2)
Epitope
Immunogen vaccine
Vector/Type: DNA, vaccinia *Strain:* B clade SF2 *HIV component:* Gag, Pol
Species (MHC) mouse (H-2^{bxd})
References Otten *et al.* 2000

- CB6F1 were primed with gag DNA by im injection and challenged with vaccinia expressing Gag/Pol (rVVgag-pol)
- Gag-specific CTL responses were detected by IFNgamma secretion in the spleen, independent of the route (intraperitoneal, intranasal or intrarectal) of rVV gag-pol challenge.
- The gag DNA vaccine induced CTL responses in 4/4 monkeys 2 weeks post immunization, but antibody responses were detected in only 1/4 monkeys after 3 immunizations.
- CTL cross-reactivity against Gag sequences 1-80, 254-323, and 421-496 was observed, suggesting multiple CTL epitope recognition.

HXB2 Location Gag
Author Location p24
Epitope
Immunogen vaccine
Vector/Type: DNA *HIV component:* Gag
Species (MHC) mouse (H-2^{d})
References Qiu *et al.* 2000

- Mice were injected with plasmid DNA at 0, 2 and 4 weeks and lymphocyte proliferation was measured after 6 weeks with recombinant p24 protein.
- Secreted HIV-1 Gag expression vectors generated a stronger response than standard Gag or cytoplasmic Gag expression vectors.
- IFN-gamma levels were increased compared to an undetectable IL-4 response.
- CTL levels were also increased in secreted Gag expression vaccination studies.

HXB2 Location Gag
Author Location Gag (SF2)
Epitope
Immunogen vaccine
Vector/Type: vaccinia *Strain:* B clade SF2 *HIV component:* Gag, Protease
Species (MHC) macaque, mouse (H-2^{d})
References zur Megede *et al.* 2000

- Sequence-modified Rev-independent gag and gag-protease gene constructs lead to increased expression levels and elevated CTL and antibody immunogenicity in BALB/c and CB6F1 mice.
- A CTL response in mice could be detected after a single immunization with codon-optimized gag, using 2 ng of plasmid; wild type gag required 200 ng to detect a response.
- Recognition of 3 different Gag peptide pools was observed, indicating a polyclonal CTL response.
- Significant gag-specific CTL responses were detected in 4/4 rhesus monkeys, in contrast to 1/4 using wildtype gag.

HXB2 Location Gag
Author Location p24
Epitope
Immunogen vaccine
Vector/Type: coxsackievirus *HIV component:* p24 Gag
Species (MHC) mouse (H-2^{d})
References Halim *et al.* 2000

- An avirulent recombinant coxsackievirus (CB4-P) construct was generated that can express p24 Gag sequences – CB4-P is attenuated even in immunodeficient mice and T help responses can be elicited from peptides embedded in a surface loop of the VP1 capsid.
- This paper describes the vaccine strategy and generation of constructs, and employs amino-terminal fusion of Gag sequences to the viral polyprotein with subsequent cleavage to elicit CTL responses via MHC class I presentation in BALB/c mice.

- BALB/c and C57BL/6 mice were immunized with recombinant Listeria monocytogenes (Lm-Gag) expressing HIV-1 HXB2 Gag and mice were challenged with vaccinia expressing Gag.
- L. monocytogenes is a gram-positive bacteria that enters the macrophage on phagocytosis and lives in the cytoplasm – secreted L. monocytogenes antigens are processed and presented by both class I and class II pathways.
- This article is a review of L. monocytogenes biology and its potential as a vaccine vector for HIV, comparing to other vector systems, and discussing CD4+ Th1 T-cells mediated Gag specific immunological protection in mice and the Gag CTL response.

HXB2 Location Gag
Author Location Gag (IIIB)
Epitope
Immunogen vaccine
Vector/Type: virus-like particle (VLP) *HIV component:* Gag
Species (MHC) macaque
References Paliard *et al.* 2000

- CTLs primed by HIV-1 p55 gag virus-like particle (VLP) vaccination recognized epitopes in four different 20 amino acid peptides p17/4, p17/8, p24/13 and p14/9.
- Cytotoxic T cell response lasted greater than 8.5 months.

HXB2 Location Gag
Author Location Gag (IIIB)
Epitope
Immunogen HIV-1 infection
Species (MHC) human
Keywords rate of progression, Th1
References Wasik *et al.* 2000

- HIV+ infants that progressed rapidly to AIDS had lower Th1 responses and decreased production of beta-chemokines and IL-2 relative to other HIV+ infants.
- HIV+ infants had no demonstrable CTL at birth, but Th1 responses accompanied by CTL responses developed in children with slowly progressive disease, and not in rapid progressors.
- CTLp frequencies were determined by limiting dilution using autologous B cells infected with vaccina/HIV constructs.

HXB2 Location Gag
Author Location Gag (LAI)
Epitope
Subtype B
Immunogen vaccine
Vector/Type: canarypox *Strain:* B clade LAI, B clade MN *HIV component:* Gag, gp41, Protease, V3
Species (MHC) human
References Salmon-Ceron *et al.* 1999

- The vaccine used was a rec canarypox with HIV-1 gp120 MN, tm/gag/protease LAI (vCP205), alone or with p24E-V3 MN synthetic peptide (CLTB-36))
- Twenty HIV negative subjects were vaccinated in phase I trial with combinations of vCP205 and CLTB-36.
- Immunization with vCP205 induced HIV-1-specific ABs to gp120, V3, and p24 antigens, and CTL immune responses against vCP205 were detected after the fourth immunization in 33% of the subjects against Env, Gag and Pol, but the CLTB-36 peptide did not produce AB or CTL immune responses against p24 or gp160.

HXB2 Location Gag
Author Location p24
Epitope
Immunogen vaccine
Vector/Type: virus-like particle (VLP) *HIV component:* p17 Gag, p24 Gag
Species (MHC) human
References Klein *et al.* 1997

- Immunization of HIV+ people with an HIV-1 p17/p24 Ty virus-like particle (p24-VLP) resulted in a marginal, short-lived increased proliferative response to p24 and p17 and a transient elevation in viral load.
- Two of four subjects that received 500 or 1000 µg of p24-VLP had an increase in gag-specific CTL.

HXB2 Location Gag
Author Location p24 (SF2)
Epitope
Immunogen vaccine
Vector/Type: DNA *Strain:* B clade SF2 *HIV component:* gp120, p24 Gag *Adjuvant:* MF59, PLG
Species (MHC) mouse, baboon
References O'Hagan *et al.* 2000

- PLG (Polylactide co-glycolide polymer) microparticles administered in MF59 emulsion induced gp120 Ab responses and CTL immune responses against p24 gag.

HXB2 Location Gag
Author Location Gag
Epitope
Immunogen HIV-1 infection
Species (MHC) human
References Lubaki *et al.* 1999

- Three strategies were used to analyze CTL activity: area under the net HIV-specific lysis curve (ACU), linear regression (LR) of net specific lysis, and the standard method, lytic units (LU20)
- A correlation between low HIV plasma viral load and increased levels of HIV-specific Gag and Nef CTL activity was observed using ACU and LR, but not LU20.

HXB2 Location Gag
Author Location Gag
Epitope
Immunogen HIV-1 infection
Species (MHC) human
References Kalams *et al.* 1999a

- The presence of HIV-1 p24-specific proliferative responses was positively correlated with Gag-specific memory CTL and negatively correlated with viral load in untreated subjects.
- Gag proliferative responses were the most readily detected – Gag CTL responses were the only responses with a significant correlation with Gag stimulated help, although there was a positive trend with Nef, Env and RT.

HXB2 Location Gag
Author Location p55 (IIIB)
Epitope
Immunogen HIV-1 infection
Species (MHC) human
References Greenough *et al.* 1999

- 7/128 HIV-1 infected hemophiliac were identified as long-term non-progressors (LTNPs) and were monitored for viral and host immune parameters over 15 years – LTNPs maintained a low viral load, high frequencies of CTL precursors directed against Gag antigen and low levels of HIV-specific effector CTL activity – effector cell activity suggests low level ongoing viral replication.

HXB2 Location Gag

- The CTL precursor level (CTLp) was measured in long term non-progressors (LTNP) with low viral load using limiting dilution analysis and measuring CTL against Env Gag and Pol expressed in vaccinia in autologous targets.
- LTNPs have high memory CTL numbers and low viral load.

HXB2 Location Gag
Author Location Gag
Epitope
Immunogen HIV-1 exposed seronegative
Species (MHC) human
Keywords review, HIV exposed persistently seronegative (HEPS)
References Rowland-Jones *et al.* 2001

- This is a review that summarizes observations about HIV-specific CTL found in the HIV-1 exposed persistently seronegative (HEPS) population.
- The CTL responses assayed by ELISPOT and by CTL precursor frequencies by limiting dilution analysis indicate that CTL in HEPS individuals tend to be of a lower magnitude than in chronic HIV-1 infections – the responses in HEPS cases are below the level of detection by tetramer assays.
- CD8+ CTL responses tend to be detectable in HEPS subjects only if they are recently exposed, and the response diminishes if exposure is reduced – it is not clear if there is a stable memory population in HEPS cases.
- CD8+ CTL responses in the HEPS population are associated with HIV-1 specific CD4+ T cell responses, assayed by proliferation assays, IL-2 secretion, and ELISPOT, and the authors consider the possibility that HIV-1-specific T-help responses improve the "quality" of the CD8+ response in HEPS individuals relative to HIV-1 infected individuals, who tend to have a poor HIV-1-specific T-help response.
- HIV-1 specific CD8+ CTL responses in HIV-1 infected individuals show reduced levels of perforin, and the T cells may not mature properly, and although similar studies have not been conducted in HEPS individuals this is considered as a possible difference in the CTL immune response in HEPS and HIV-1 infected people.

HXB2 Location Gag
Author Location
Epitope
Subtype B
Immunogen vaccine
Vector/Type: DNA *HIV component:* Env, Gag, Pol
Species (MHC) mouse
Keywords review, vaccine-specific epitope characteristics
References Nabel 2002

- Using DNA that had humanized codon usage, CTL responses to DNA vaccines containing either Gag, Pol, Gag-Pol fusion protein, or Gag-Pol pseudoparticles suggested that the greatest breadth and most potent response was to the Gag-Pol fusion protein. The Gag-Pol fusion lacks the Gag precursor protein required for viral assemble, so does not form releaseable particles; the author speculates that longer retention of the Gag-Pol protein with in the cell may enhance antigen presentation.

Epitope
Immunogen vaccine
Vector/Type: vaccinia *HIV component:* Gag *Adjuvant:* block copolymer CRL8623
Species (MHC) macaque
Assay type CD8 T-cell Elispot - IFNγ
Keywords vaccine-induced epitopes
References Caulfield *et al.* 2002

- Codon-optimized HIV Gag DNA vaccines were given i.m. with or without a nonionic block copolymer(CRL8623) as adjuvant. DNA-CRL8623 fourmulations induced 2-fold higher Elispot responses, shifting the response towards CD8+ T-cells.
- 23 monkeys recognized 25 different epitopes with an average of 2.7 epitopes per monkey, and a minimum of 1 and a maximum of 5 peptides per monkey.
- Responses were detected up to 18 months after vaccination.

HXB2 Location Gag
Author Location Gag
Epitope
Subtype multiple
Immunogen
Species (MHC) human
Assay type Flow cytometric T-cell cytokine assay
Keywords subtype comparisons
References Currier *et al.* 2003

- CD8-cellular immune responses from 21 HIV-1 infected patients from Kenya infected with subtype A, C, D, and unique recombinants were studied for cross-recognition of Gag, Env, and Nef vaccinia-expressed proteins representing subtypes A-H, including CRF01.
- Both subtype-specific and cross-reactive CTL were observed, with a skewing of responses towards the infecting subtype in the nine subjects with full length sequence available. The magnitude of the responses to Gag were the highest, less to Nef, and still less to Env.
- For Gag, 8/21 subjects responded to at least 7/8 different subtype proteins, 7 had a mixed response, recognizing some subtypes but not others, and 6 responded to only one or none of the different subtype proteins. For Env, 4/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 7 responded to one or none. For Nef, 5/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 6 responded to one or none.

HXB2 Location Gag
Author Location Gag (SF2)
Epitope
Subtype B
Immunogen vaccine
Vector/Type: DNA, protein, virus-like particle (VLP), PLG microparticle *Strain:* B clade SF2 *HIV component:* Gag *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72), LTK63
Species (MHC) macaque
Assay type proliferation, Chromium-release assay
References Otten *et al.* 2003

CTL CD8+

- Immunization strategies for Gag (p55) in macaques were compared. GAG DNA prime with a boost of Gag adsorbed onto PLG (polyactide coglycolide) microparticles with LTK63 as adjuvant gave the strongest CD4+ T cell proliferative, CTL, and antibody responses, compared with Gag protein, or Gag virus-like particles (VLP). GAG DNA was best for inducing CTL responses, Gag-PLG for T-help and antibody; the prime-boost combination gave strong responses for all three.

HXB2 Location Gag
Author Location Gag
Epitope
Subtype C
Immunogen HIV-1 infection
Species (MHC) human
Country South Africa
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression, immunodominance, acute/early infection, early-expressed proteins
References Masemola *et al.* 2004a

- Anti-HIV T-cell responses in subtype C HIV-1 infected individuals in the beginning of the infection target multiple protein regions, but the responses are dominated by Nef, making up almost one-third of the total responses; the second most targeted protein was p24. A correlation between Gag specific responses and plasma viral load was also found.
- Neither breadth nor magnitude of CD8+ T-cell responses were correlated with control of virus, however hierarchical preferential targeting of Gag was significantly associated with lower viral loads.

HXB2 Location Gag

HXB2 Location Gag/Pol TF (24–31)
Author Location p6 (35–42 HXB2)
Epitope NSPTRREL
Epitope name NL8
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (Cw*0102)
Donor MHC A*0201, A*2501, B*1801, B*5101, Cw*0102, Cw*1203
Assay type CD8 T-cell Elispot - IFNγ
Keywords escape, immune evasion, optimal epitope
References Liu *et al.* 2006b

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.
- Position4 in the epitope had potentially experienced positive selection. NsptRREL and tSPTRREL escape variants were found.

HXB2 Location Gag/Pol TF (24–31)
Author Location Pol
Epitope NSPTRREL
Epitope name NL8
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (Cw*0102)
Country United States
Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay
Keywords binding affinity, escape, immune evasion, drug resistance
References Cao *et al.* 2008

- For the first time, viral immune evasion is reported via an insertion mutation, in an ART-naive patient. A 3 aa repeat, SPT inserted within p6<sup>Pol<sup> epitope NL8 is reported, changing it to NsptSPTRREL (NL11). This insertion is associated often with ART drug resistance to NRTI drugs. Thus immune pressure and drug resistance may cause HIV-1 to select the same variation.
- Insertion from NL8 to NL11 changes the minimum epitope to tSPTRREL. Another variant seen later was tSPTiREL.
- A concomitant insertion mutation APP, is seen in p6<sup>Gag<sup>, permitting viral budding.
- Epitope NSPTRREL escapes to NSPT(SPT)RREL in subject PIC1362. Addition of an N-terminal Alanine to NL8 (aNSPTRREL) does not affect in vitro MHC I binding. Deletion of the C-terminal L as in peptide aNSPTRRE (AE8), however, shows that Leu is necessary for MHC I binding.

HXB2 Location Gag/Pol TF (26–34)
Author Location Pol
Epitope PTRRELQVW
Epitope name PW9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B57)
Country Netherlands
Assay type CD8 T-cell Elispot - IFNγ
Keywords computational epitope prediction
References Schellens *et al.* 2008

- Peptide prediction programs based on MHC binding, proteasomal cleavage and TAP transport were applied to select novel epitopes absent from the Los Alamos HIV database. 22 novel epitopes were tested by IFN-gamma ELISpot and 19 (11 HLA-B27 restricted, 8 HLA-B57 restricted) induced strong positive responses.
- Magnitude of response generated was similar to that of previously identified epitopes, but the number of individuals responding was lower. This could be explained by less stringent HLA-typing of subjects and perhaps high sequence variability within these novel epitopes.
- PW9(Pol), PTRRELQVW, is a novel HLA-B57-restricted epitope that elicits a CTL IFN-gamma response in the same range as Los Alamos database peptides.

Author Location Pol (C-96BW15C05)
Epitope AGAERQGTL
Epitope name C
Subtype C
Immunogen vaccine
Vector/Type: DNA, alphavirus replicon *Strain:* C clade C-96BW04.09, C clade C-96BW15C05 *HIV component:* Gag, Gag-Pol, Pol
Species (MHC) mouse (H-2^d)
Assay type Flow cytometric T-cell cytokine assay
Keywords vaccine-induced epitopes, vaccine antigen design
References Megede *et al.* 2006

- HIV clade C gag, pol and fusion gagpol vaccines were compared in mice. Breadth of T cell responses was improved in mice immunized with gagpol fusion genes, compared to single antigen constructs. 5 new murine CD8+ T cell epitopes were mapped.
- This is a novel epitope.

HXB2 Location Gag/Pol TF (54–6)
Author Location Pol
Epitope FSFPQITLW
Epitope name FW9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B57)
Country Netherlands
Assay type CD8 T-cell Elispot - IFNγ
Keywords computational epitope prediction
References Schellens *et al.* 2008

- Peptide prediction programs based on MHC binding, proteasomal cleavage and TAP transport were applied to select novel epitopes absent from the Los Alamos HIV database. 22 novel epitopes were tested by IFN-gamma ELISpot and 19 (11 HLA-B27 restricted, 8 HLA-B57 restricted) induced strong positive responses.
- Magnitude of response generated was similar to that of previously identified epitopes, but the number of individuals responding was lower. This could be explained by less stringent HLA-typing of subjects and perhaps high sequence variability within these novel epitopes.
- FW9, FSFPQITLW, is a novel HLA-B57-restricted epitope that elicits a CTL IFN-gamma response in the same range as Los Alamos database peptides.

II-B-9 Gag/Pol TF-Protease CTL/CD8+ epitopes

HXB2 Location Gag/Pol TF-Protease (54–6)
Author Location Pol
Epitope `FSFPQITLW`
Epitope name FW9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Donor MHC A11, A2, B18, B44, Cw12, Cw5
Country United States
Assay type CD8 T-cell Elispot - IFNγ
Keywords subtype comparisons, escape, characterizing CD8+ T cells, viral fitness and reversion
References Allen *et al.* 2005a

- Two-thirds of all mutations arising in non-envelope proteins during the transition from acute to chronic infection were found to be due to either CD8 T-cell-associated selective pressures or reversion of HLA-I-associated mutations selected in a previous host.The predominance of escape mutations at highly polymorphic sites was observed across different HIV-1 clades.
- An escape mutation at position 2, fNfpqitlw, was found in the most polymorphic residue in the epitope. This is a novel partially mapped epitope.

II-B-10 Protease CTL/CD8+ epitopes

HXB2 Location Protease (2–19)
Author Location (C consensus)
Epitope `QITLWQRPLVSIKVGGQI`
Subtype C
Immunogen HIV-1 infection
Species (MHC) human (Cw*0801)
Country South Africa
Assay type CD8 T-cell Elispot - IFNγ
Keywords rate of progression
References Kiepiela *et al.* 2007

- A comprehensive analysis of 160 class I T cell responses in 578 individuals from KwaZulu-Natal, South Africa was performed. Gag-specific responses were associated with lowering viremia, while Env, accessory and regulatory protein-specific responses were associated with higher viremia.

HXB2 Location Protease (3–11)
Author Location RT (71–79 subtype A, B, D)
Epitope `ITLWQRPLV`
Subtype A, B, D
Immunogen
Species (MHC) human (A*6802)

References Llano *et al.* 2009

- C. Brander notes this is an A*6802 epitope.

HXB2 Location Protease (3–11)
Author Location Pol
Epitope `ITLWQRPLV`
Subtype A, B, C, D
Immunogen HIV-1 infection, vaccine
Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag
Species (MHC) human (A*6802)
Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance
References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Author Location Pol (59–)
Epitope ITLWQRPLV
Epitope name Pol59
Immunogen HIV-1 infection, vaccine
Vector/Type: peptide *HIV component:* Protease *Adjuvant:* Incomplete Freund's Adjuvant (IFA)
Species (MHC) transgenic mouse (A2)
Keywords binding affinity, subtype comparisons, computational epitope prediction
References Corbet *et al.* 2003

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This peptide was an intermediate A2 binder, and induced CTL and CD8+ T-cell IFN gamma responses in mice. Responses to the peptide were not detected in 17 HIV+ HLA-A2 subjects.

HXB2 Location Protease (3–11)
Author Location
Epitope ITLWQRPLV
Epitope name Pol 59
Immunogen HIV-1 infection
Species (MHC) human (A2)
Country Denmark
Assay type CD8 T-cell Elispot - IFNγ, Intracellular cytokine staining, Chromium-release assay, Flow cytometric T-cell cytokine assay
References Thorn *et al.* 2007

- 11 HLA-A2+ (A*0201, A*0220, A*0234 or A*0236), patients' HIV were sequenced. Of 28 epitopes studied, most were conserved and elicited a subdominant CTL response. 9 epitopes in 7 proteins showed T-cell cross reaction. These epitopes were optimized to induce more immunogenic but cross-reacting responses.
- Epitopes in Gag, Pol, Env, Nef were more conserved than epitopes in shorter proteins Vpu, Vif, Vpr and Rev. Most natural epitopes were untargeted or targeted by 1 or 2 patients.
- Previously characterized HLA-A2 epitope, Pol 59 ITLWQRPLV, was present in 9 patients but none had a CTL immune response to it.

HXB2 Location Protease (3–11)
Author Location Pol (59–65)
Epitope ITLWQRPLV
Immunogen HIV-1 infection
Species (MHC) human (A28)
References Ferrari *et al.* 2000

- One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.

HXB2 Location Protease (3–11)
Author Location Pol (60–68)
Epitope ITLWQRPLV
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A28)

Country China
Assay type CD8 T-cell Elispot - IFNγ
References Zhai *et al.* 2008

CTL CD8+

- 49 ART-naive chronically HIV-1 infected Chinese subjects' CTLs were tested with 413 OLPs in IFN-gamma assays, determining optimal epitopes specific for Chinese Clade B HIV-1 sequences.
- An inverse correlation was found between CTL response and viral load.
- Targeted peptides have lower entropy than peptides that are not CTL targeted. This correlation is independent of HLA-restriction.
- Previously described HLA-A68-restricted epitope ITLWQRPLV elicited an immune response in Chinese HIV-1 positive subjects as part of peptide SFSFPQITLWQRPLVTIK.

HXB2 Location Protease (3–11)
Author Location Pol
Epitope ITLWQRPLV
Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (A74)
Keywords HIV exposed persistently seronegative (HEPS)
References Kaul *et al.* 2001a

- ITLWQRPLV cross-reacts with clades A, B and D.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.

HXB2 Location Protease (4–14)
Author Location Pol (60–70 SF2)
Epitope TLWQRPLVTIR
Subtype B
Immunogen HIV-1 infection, computer prediction
Species (MHC) human (A*3303)
Assay type Chromium-release assay
Keywords binding affinity, computational epitope prediction
References Hossain *et al.* 2003

- HLA-A*3303 is a common HLA allele in east and southeast Asia. Pol, Gag and Nef SF2 proteins were scanned for potential A*3303 epitopes. 99 potential epitopes were synthesized, and 52/99 bound to A*3303. Six of these served as peptide-targets for lysis by PBMC from infected individual, and clones derived from 4 of these 6 could lyse HIV-vaccinia infected target cells, indicating proper processing.
- This epitope is one of the 4 that are properly processed.

HXB2 Location Protease (7–15)

Country Australia
Assay type Intracellular cytokine staining
Keywords HAART, ART, immunotherapy, variant cross-recognition or cross-neutralization, optimal epitope
References Stratov *et al.* 2005

- CD8 T-cells targeting epitopes spanning drug resistance induced mutations were detected in 3/25 individuals harboring multidrug-resistant HIV-1. Novel CD8 T-cell responses were detected against epitopes with common protease inhibitor fitness mutations. T-cell immunity to drug-resistant variants was confirmed in SHIV-infected macaques, where CD8 and CD4 immune responses to RT and protease resistance mutations were elicited using peptide-based immunotherapy.
- QRPLVTIKI carries the the L10I protease inhibition mutation and was recognized in a multidrug resistant individual. Response against wild-type epitope qrpIvtiki was detected.
- The 3 people that responded to the drug resistant forms of the virus were among those that had the highest levels of CD4 and CD8 T-cell responses, indicating that they were among the most immunocompetent.

HXB2 Location Protease (7–16)
Author Location Protease (7–16 HXB2)
Epitope QRPLVTVKIG
Epitope name QG10
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B51)
Country Germany
Assay type CD8 T-cell Elispot - IFNγ
Keywords escape, immune evasion, HLA associated polymorphism, drug resistance
References Mueller *et al.* 2007

- To assess HIV-1-specific CTL influence on development and patterns of drug resistance in protease (PR) 94 HLA-typed patients were analyzed. 10 new CTL epitopes were defined statistically and experimentally, and 26 correlations (positive and negative) between HLA class-I alleles and PR mutations - some leading to escape mutations - were detected, demonstrating that CTL epitopes can be predicted based on HLA-amino acid substitution associations.
- Some patient CTL escape mutations were detectable by other CTLs of the same patient. Correlations between resistance mutations, polymorphisms and specific PR inhibitors were not detected.
- HLA-B had the strongest impact on PR sequence change, though HLAs-A and -C also had some impact.
- The authors suggest that CTL escape is active in developing drug-resistance related polymorphisms as well as major and minor mutations in HIV-1 infected persons.
- HIV-1 subtype breakdown in this cohort was follows - 83/94 patients infected with subtype B virus, 3 with subtype C, 4 CRF01_AE, 1 CRF03_AB, 1 CRF15_01B and 2 subtype Ds.
- This newly defined epitope, QRPLVTVKIG, QG10, carried an HLA-B51-associated drug polymorphism at K14R, QRPLVTVrIG and another mutation at L10I, QRPiVTVKIG.

HXB2 Location Protease (11–20)
Author Location Pol (98–)
Epitope VTIKIGGQLK
Immunogen vaccine
Vector/Type: DNA, polyepitope *Strain:* multiple epitope immunogen
Species (MHC) human (A*0301)
Country Botswana, United States

Assay type CD8 T-cell Elispot - IFNγ, Chromium-release assay
Keywords vaccine antigen design
References Gorse *et al.* 2008

- This is a trial of a multi-epitope DNA vaccine that included 21 CTL epitopes, which are conserved among clades A,B,C,D and CRFs and are supertype binding peptides of A1, A3 and B7 supertypes. Participants were from US and Botswana.
- The vaccine was safe and well-tolerated, but the rate of CTL induction was low. CD8+ responses (and no CD4+ responses) were detected in 3/26 subjects using chromium release assay and in 2/42 subjects using IFN-γ ELISPOT assay.
- This epitope was included in the vaccine.

HXB2 Location Protease (11–20)

Immunogen HIV-1 exposed seronegative
Species (MHC) human (A*6802)
Keywords subtype comparisons
References Rowland-Jones *et al.* 1998b

- HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi—these CTL may confer protection.
- Seroprevalence in this cohort is 90-95% and their HIV-1 exposure is among the highest in the world.

- Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes.
- This epitope is conserved among B and D clade viruses.
- The Clade A version of the epitope: DTVLEDINL.
- This epitope was recognized by two different exposed and uninfected prostitutes.
- This epitope was identified by screening 49 HIV-1 peptides with the predicted A*6802 anchor residue motif x(VT)xxxxxx(VL)

HXB2 Location Protease (30–38)
Author Location Pol (subtype A)
Epitope DTVLEDINL
Subtype A
Immunogen HIV-1 exposed seronegative
Species (MHC) human (A*6802)
References Kaul *et al.* 2000

- 11/16 heavily HIV exposed but persistently seronegative sex-workers in Nairobi had HIV-specific CD8 IFNγ responses in the cervix—systemic CD8+ T cell responses tended to be to the same epitopes but at generally lower levels than cervical CD8+ T cell responses.
- Low risk individuals did not have such CD8+ cells.
- CD8+ T cell epitopes: DTVLEDINL (3 individuals), SLYNTVATL (4 individuals), LSPRTLNAW (3 individuals) and YPLTFGWCF (4 individuals) were most commonly recognized by the HIV-resistant women.

HXB2 Location Protease (30–38)
Author Location RT (85–93 subtype D)
Epitope DTVLEEWNL
Subtype D
Immunogen
Species (MHC) human (A*6802)
Keywords optimal epitope
References Llano *et al.* 2009

- C. Brander notes this is an A*6802 epitope.

HXB2 Location Protease (30–38)
Author Location Pol (subtype A)
Epitope DTVLEDINL
Subtype A
Immunogen HIV-1 infection
Species (MHC) human (A*6802)
Keywords HIV exposed persistently seronegative (HEPS), escape
References Kaul *et al.* 2001c

- This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative.
- DTVLEDINL was recognized in 3 of the 6 women (ML857, ML1203, and ML1707), and the response was present in the last available sample prior to seroconversion, 3-7 months.
- In each of the three women, 20/20 sequences of the infecting strain had no substitutions in this epitope, all were DTVLEDINL, so there was no evidence for escape.
- The epidemiological factor associated with seroconversion was stopping sex work. HIV-specific CTL activity declined when HEPS sex workers stopped working for a period or retired.
- This epitope was recognized in 3/22 HEPS sex worker controls, ML851, ML1432, and ML1601.

Author Location Pol (85–93)
Epitope DTVLEDINL
Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (A*6802)
Keywords HIV exposed persistently seronegative (HEPS), immunodominance
References Kaul *et al.* 2001a

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-A*6802 women, 11/12 HEPS and 6/11 HIV-1 infected women recognized this epitope likelihood ratio 4.4, p value 0.08, and HEPS women tended to respond to DTVLEDINL, infected women tended to ETAYFILKL.
- The dominant response to this HLA allele was to this epitope in 10 of the 11/12 HEPS cases, but in only 4 of the 6/11 HIV-1 infected women.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.
- Four epitopes were considered to be "resistant epitopes", as they were preferentially reactive in HEPS women and so may confer resistance, and these were found in three different proteins: A2 ILK(D/E)PVHGV in RT, A*6802 DTVLEDINL in Protease, B14 DLN(M/T)LN(I/V)V in p24 and B18 FRDYVDRF(Y/F)K also in p24.
